## How to find best coating for your material applications

## Advisory for Safe Use of End Mills

---

Correct application and operation is strongly advised to avoid clogging, abrasion, etc, that could cause serious accidents or injuries.

Ignition or sparks generated during milling could lead to fire or extreme damage to the work piece.

End Mills are made with very sharp cutting edges and must be handled with extra care.

- Never touch the cutting edge with your bare hands, as this could cause serious injury. Special caution is required when opening the package.
- Dropping the tool could cause breakage or flying debris, leading to serious injury.
- During milling, unexpected impact or shock on the tool could cause breakage or flying debris. Ensure to use protective items such as safety glasses and a face guard.
- For best results, fine parameter adjustment may be required, depending on the materials; milling shape and strategy; machine rigidity and spindle capability.
- Use a machine that has high rigidity and generates a low level of vibration. Recommend setting the runout control value at  $5\mu\text{m}$  or below for the small diameter tools  $\phi 1$  or below.
- Do not use flammable cutting oils.

### Advisory for Regrinding End Mills

- Never regrind the tool without wearing safety glasses and a face guard.

# *Value Series*

*ϕ3mm Shank End Mills*

Recommended for improved milling quality and cost reduction!

# New $\phi 3$ mm shank

Union Tool's new standard: Value series

## $\phi 3$ mm Shank (h4 tolerance) × Overall length 38 mm

Fixed size of  $\phi 3$  Shank × Overall Length 38 mm

$\phi 3$  shank is used to save valuable carbide material. h4 tolerance is compatible for both shrink fit and collet holders. More series to follow in the future.

## Cost effective

PCB drills mass production technology is applied to end mills.

To attain affordable prices, we applied our existing and proven automatic mass production technology for blank rods, flute grinding, coating and inspection to these new end mills.

## High Quality

Small diameter V series are high-precision as a result of using the latest in-house technologies.

We developed new grinding machines specialized for small diameter end mills for high-precision milling that will innovate manufacturing technology for high-precision, high-efficiency milling.

Our in-house developed production facility for PCB tools

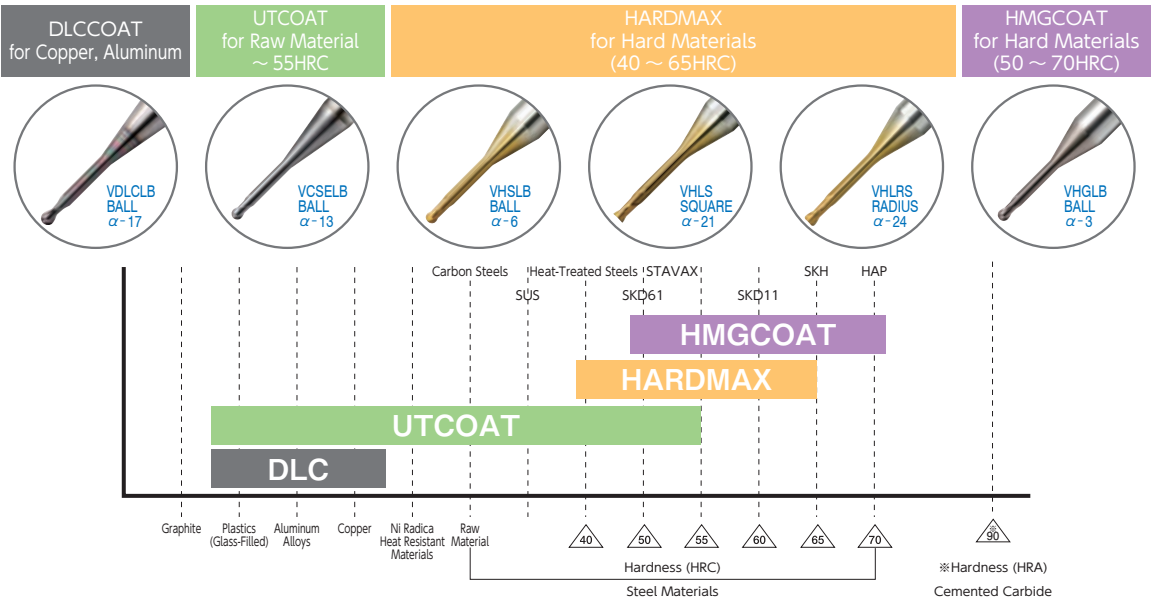

Over 5 million coated PCB tools manufactured every month

Carefully crafted in Mitsuke of Niigata prefecture

PCB: Printed Circuit Board

## Long Neck Ball End Mills R0.5 x Effective Length 6

Milling examples of shank diameter difference between  $\phi 3$  mm &  $\phi 4$  mm

### Comparison of tool wearing and Dimensional accuracy

<Condition>

Work material : SKD11(60HRC) (DIN : 1.2379, AISI : D2)  
 Coolant : Air blow  
 Tool holder : Collet holder  
 Milling shape : Pocket (□8mm x 8mm x depth 3mm)  
 Cycle time : about 35 min.

$n$  : 21,500 min<sup>-1</sup>  
 $V_f$  : 1,250 mm/min  
 $a_p$  : 0.03 mm  
 $a_e$  : 0.17 mm

<Tool damage>

If the overhang is shortened, the performance equivalent to that of a  $\phi 4$ mm shank can be obtained.

- Drill
- Technical Data

**Note:**

- Decrease the feed rate more than 50% from the milling parameters when slot milling.
- Decrease both spindle speed and feed rate proportionally when the milling parameters exceed the machine's maximum spindle speed, or when the tool is chattering and heats up to a red color.
- Every coolant offers stable milling.

**Note:**

- Decrease the feed rate more than 50% from the milling parameters when slot milling.
- Decrease both spindle speed and feed rate proportionally when the milling parameters exceed the machine's maximum spindle speed, or when the tool is chattering and heats up to a red color.
- Every coolant offers stable milling.
- Recommend wet coolant for Copper.

# Long neck ball end mill R0.5 x Effective length 6mm

## The comparison example of different shank diameter between $\phi 3\text{mm}$ & $\phi 4\text{mm}$

### Comparison of roughness and reflection of the aspherical surface (Finishing process).

The upper surface of the square prism was processed aspherically, and the surface roughness and reflection were compared. We obtained the same results as the  $\phi 4\text{mm}$  shank in terms of surface roughness and reflection.

<Condition>

- Work material : HAP10(64HRC)
- Coolant : Air blow
- Tool holder : Hydraulic chuck
- Milling shape : Aspherical surface ( $5\text{mm} \times 5\text{mm}$ ) R25
- Cycle time : about 26 min.
- $n$  : 29,600  $\text{min}^{-1}$
- $V_r$  : 500  $\text{mm}/\text{min}$
- $a_p$  : 0.015  $\text{mm}$
- $a_e$  : 0.006  $\text{mm}$

**Note:**

- Decrease the feed rate more than 50% from the milling parameters when slot milling.
- Decrease both spindle speed and feed rate proportionally when the milling parameters exceed the machine's maximum spindle speed, or when the tool is chattering and heats up to a red color.
- Recommend oil coolant for Stainless Steels and Heat Resistant Alloys.
- Recommend wet coolant for Copper.

Except for R0.05~R0.15

The shank taper angle shown is not an exact value and to avoid contact with the work piece, we recommend the user controls the precise value of this angle. Shank taper angle should not make contact with the work piece.

Label Sample

#001 φD0.997 R+0.001/-0.001

Diameter and Ball R accuracy measurements are printed on the label to support High Precision milling.

**Note:**

- Decrease the feed rate more than 50% from the milling parameters when slot milling.
- Decrease both spindle speed and feed rate proportionally when the milling parameters exceed the machine's maximum spindle speed, or when chattering occurs.
- Recommend wet coolant for Copper, Aluminum alloy and Tungsten-Copper.

# Milling Example of Copper Electrode Model (Tough Pitch Copper)

## R1 x Effective length 8mm

### The comparison example of VDLCLB( $\phi 3$ shank) and DLCLB( $\phi 4$ shank)

#### Comparison of tool wearing

<Condition>

Work material : Tough Pitch Copper  
 Coolant : Oil mist  
 Milling shape : □20 mm x 20 mm x height 8 mm

<Tool>\*1

VDLCLB 2020-080 ( $\phi 3$  shank)  
 DLCLB 2020-080 ( $\phi 4$  shank)  
 \*1 1 for roughing to semi-finishing, 1 for finishing  
 total 2 ea.  
 \*2 Both models are set so that the overhang of shank is 2 mm.

| No.   | Milling Process | Spindle speed (min <sup>-1</sup> ) | Feed rate (mm/min) | ap (mm) | ae (mm) | Allowance (mm) | Cycle time/ 1 pc    |
|-------|-----------------|------------------------------------|--------------------|---------|---------|----------------|---------------------|
| 1     | Roughing        | 18,700                             | 1,800              | 0.4     | 0.8     | 0.08           | 14 min. 6 sec.      |
| 2     | Semi-finishing  | 18,700                             | 1,800              | 0.05    | 0.05    | 0.03           | 1 h 17 min. 24 sec. |
| 3     | Finishing       | 18,700/<br>30,000(Bottom)          | 900                | 0.03    | 0.03    | 0              | 1 h 17 min. 0 sec.  |
| Total |                 |                                    |                    |         |         |                | 2 h 48 min. 30 sec. |

VDLCLB( $\phi 3$  shank)  
Milling application

DLCLB( $\phi 4$  shank)  
Milling application

[Tool after 10pcs milling ]

VDLCLB  
( $\phi 3$  shank)

DLCLB  
( $\phi 4$  shank)

Roughing to  
Semi-finishing

Cycle time:  
15 h 15 min

Finishing

Cycle time:  
12 h 50 min.

No difference of tool wearing with regard to the shank diameter gap.

## Comparison of dimensional accuracy and roughness

Measuring for dimensional accuracy of vertical wall and roughness of concave surface.

Measuring position for dimensional accuracy (Left)

Measuring position for roughness

Measuring position for dimensional accuracy (Right)

Both the dimensional accuracy and roughness gave very similar results, with no difference with regard to the shank diameter gap.

**Note:**

- Recommend using a non-contact measuring device to avoid damaging the precision tip point.
- Decrease both spindle speed and feed rate proportionally when the milling parameters exceed the machine's maximum spindle speed.
- Every coolant offers stable milling.
- Recommend oil coolant for Stainless Steels and Heat Resistant Alloys.
- Recommend wet coolant for Copper.

Technical Data

**Note:**

- Decrease both spindle speed and feed rate proportionally when the milling parameters exceed the machine's maximum spindle speed.
- Every coolant offers stable milling.
- Recommend oil coolant for Stainless Steels and Heat Resistant Alloys.
- Recommend wet coolant for Copper.

For Cemented Carbide and Hard Brittle Materials

*UDC Series*

*ULTRA DIAMOND COAT*

# Features of UDC series

## Optimized diamond coating for Cemented Carbide and Hard Brittle Materials

Coating Patented in Japan

Special high-performance Diamond film.  
New Diamond coating developed to improve hardness and durability, with outstanding adhesion to the cutting tool.

### Sandblasting tests the film adhesion and wear resistance

UNION TOOL's Diamond film that coated using the hot filament CVD method is developed to improve hardness and durability, with outstanding adhesion to the cutting tool. Using fine particle composition control, the UDC coating has dramatically improved hardness and durability.

## Direct Milling of Cemented Carbide - No Grinding!

The normal expectation when milling Cemented Carbide would be a powdered swarf...

By using a deep cut into the Cemented Carbide, UDCB creates a "fan shaped" chip, just like cutting steel!

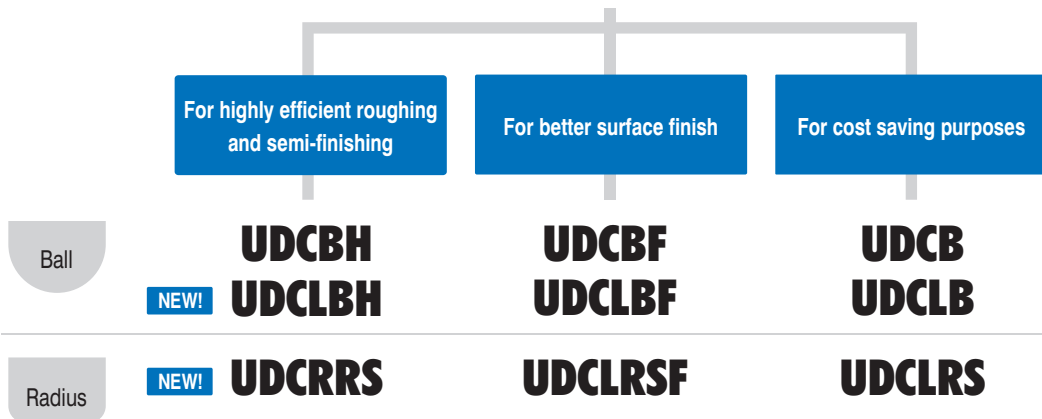

### UDCB R0.5 Ball End Mill

|               |                             |

| Work Material | VM-40 (90HRA)               |

# Choose by application

The long-awaited 3rd generation UDC!

## UDC-H series

Patent pending

The best match for roughing and semi-finishing of cemented carbide.

### Features of H series

- High-level Treatment!!** → Unbelievable milling performance
- High Speed!!** → Mill at surprisingly high feed rate
- High Material Removal Volume!!** → Highly improved material removal volume

### Attain both high efficiency and long tool life!

The key points

New generation edge treatment minimizes tool damage

Improved diamond coating to enhance wear resistance

# UDCBH

**7.5 times**  
the efficiency

**Over 4 times**  
the removal volume

Work Size : 50 x 50 x 10 mm

Pocket Size : Top  $\phi$  10 x Depth 3.5 mm

Material Removal Volume : 160 mm<sup>3</sup> / Pocket

Coolant : Air Blow

UDCBH shows maximum tool performance under high-speed conditions.  
Tool life may shorten when used at the same feed rate as before.

The sharpest cutting edge in the UDC series

# UDC-F series

The best choice for high quality milling surface

## Features of F series

### ① UDC coating

Optimized coating for F series

### ② Special treatment for a sharp edge

Minimized edge chipping and the level of the gap

### ③ Chip pocket designed on tool tip

Excellent surface finish

Cemented Carbide Flat surface milling Comparison of edge chipping on work piece with UDCBH / UDCBF R0.4 × L0.56

## Features

High efficiency and long life Ball End Mills for milling cemented carbide.  
 High-level treatment to reduce cutting resistance and mill at a high feed rate.  
 Wear resistance improved drastically with optimized Diamond coating.  
 Best for roughing and semi-finishing.

Label Sample

#001  $\phi D1.997 R+0.001/-0.001$

Diameter and Ball R accuracy measurements are printed on the label to support High Precision milling.

The shank taper angle shown is not an exact value and to avoid contact with the work piece, we recommend the user controls the precise value of this angle. Shank taper angle should not make contact with the work piece.

These milling parameters are based on VF-20, VM-40, VC-70, VU-70 (TAS standard) for Cemented Carbide, and Alumina for Hard Brittle Materials. These are for reference only.

Tool life may differ depending on the type of Cemented Carbide / Hard Brittle Materials.

For best result, fine parameter adjustments may be required, depending on the materials of Cemented Carbide / Hard Brittle Materials; milling shape and strategy; machine rigidity and spindle capability.

※ Feed Rate2: Feed rate of approach and \*connection moves.

\*Changing from one engagement point to the next.

- Note:
- This application requires a high cutting force. A machine with poor rigidity and high vibration is not recommended.
  - Allow sufficient machine and spindle warm-up time for stability and to remove any expansion of the main spindle before running the program.
  - Tool setting length should achieve the least possible overhang.
  - Avoid contact with the coated area of the shank. This will prevent tip vibration and tool jamming in the collet / holder.
  - Run-out and vibration should be checked dynamically at the tool point while mounted in the machine and both should achieve the lowest level possible.
  - Use an inclined or helical approach (Recommended inclination angle:  $< 5$  degree).
  - Decrease both spindle speed and feed rate proportionally.
  - Air blow is highly recommended for longer tool life. Both oil mist and oil coolant are alternatives.
  - Recommend water soluble coolant for Hard Brittle (Non-Metallic) Materials.
  - When milling some work pieces, heavier chips may be created. To evacuate these chips it is important to accurately position the coolant nozzle on the milling part.
  - Remove chips to prevent heat generation and ignition during milling process.
  - Protective gear, such as safety glasses and face guards are required when milling.
  - Chips / dust generated while milling can have adverse affects on the machine parts if they are not properly evacuated. Take steps to assure proper evacuation.
  - The tool life may shorten due to a large difference between the commanded feed speed and the actual machining speed caused by factors as machining model and machining machine.
  - Decrease both feed rate and feed rate 2 proportionally.
  - Tool damage may progress rapidly near the end of the tool life.

\* Hard Brittle (Non-Metallic) Materials: Ceramics (Alumina, Zirconia, etc.), Glasses and etc.

**Features**

Ball type End Mills for milling Cemented Carbide and Hard Brittle (Non-Metallic) Materials. Upgraded version of UDCB. New Diamond coating and flute design increase material removal amount. Chip pocket designed on tool tip improves the surface finishing quality. Special cutting edge treatment helps to avoid the edge chipping & level gap. Recommended to use on semi-roughing & finishing process.

The shank taper angle shown is not an exact value and to avoid contact with the work piece, we recommend the user controls the precise value of this angle. Shank taper angle should not make contact with the work piece.

Label Sample

#001 φD0.797 R+0.003/0.000

Diameter and Ball R accuracy measurements are printed on the label to support High Precision milling.

These milling parameters are based on VF-20, VM-40, VC-70, VU-70 (TAS standard) for Cemented Carbide, and Alumina for Hard Brittle Materials. These are for reference only. Tool life may differ depending on the type of Cemented Carbide / Hard Brittle Materials. For best result, fine parameter adjustments may be required, depending on the materials of Cemented Carbide / Hard Brittle Materials; milling shape and strategy; machine rigidity and spindle capability.

※ Feed Rate2: Feed rate of approach and \*connection moves.  
\*Changing from one engagement point to the next.

- Note:
- This application requires a high cutting force. A machine with poor rigidity and high vibration is not recommended.
  - Allow sufficient machine and spindle warm-up time for stability and to remove any expansion of the main spindle before running the program.
  - Tool setting length should achieve the least possible overhang.
  - Avoid contact with the coated area of the shank. This will prevent tip vibration and tool jamming in the collet / holder.
  - Run-out and vibration should be checked dynamically at the tool point while mounted in the machine and both should achieve the lowest level possible.
  - Use an inclined or helical approach (Recommended inclination angle: <5 degree).
  - Decrease both spindle speed and feed rate proportionally.
  - Air blow is highly recommended for longer tool life. Both oil mist and oil coolant are alternatives.
  - Recommend water soluble coolant for Hard Brittle (Non-Metallic) Materials.
  - When milling some work pieces, heavier chips may be created. To evacuate these chips it is important to accurately position the coolant nozzle on the milling part.
  - Remove chips to prevent heat generation and ignition during milling process.
  - Protective gear, such as safety glasses and face guards are required when milling.
  - Chips / dust generated while milling can have adverse effects on the machine parts if they are not properly evacuated. Take steps to assure proper evacuation.

\*1 DCB/DCLB series are highly recommended for Glass Filled Plastic milling.  
 \*2 Hard Brittle (Non-Metallic) Materials: Ceramics (Alumina, Zirconia, etc.), Glasses and etc.

**Features**

Ball type End Mills for milling Cemented Carbide and Hard Brittle (Non-Metallic) Materials. Developed to give improved hardness and durability, new Diamond coating also has outstanding adhesion to the cutting tool. By combining the new coating with optimum cutting geometries, the tool “deep cuts” the work piece. Leaves a burr and pit free surface finish on semi-roughing & finishing process.

The shank taper angle shown is not an exact value and to avoid contact with the work piece, we recommend the user controls the precise value of this angle. Shank taper angle should not make contact with the work piece.

Label Sample

#001 φD1.983 R0.000/-0.005

Diameter and Ball R accuracy measurements are printed on the label to support High Precision milling.

These milling parameters are based on VF-20, VM-40, VC-70, VU-70 (TAS standard) for Cemented Carbide, and Alumina for Hard Brittle Materials. These are for reference only.

Tool life may differ depending on the type of Cemented Carbide / Hard Brittle Materials. For best result, fine parameter adjustments may be required, depending on the materials of Cemented Carbide / Hard Brittle Materials; milling shape and strategy; machine rigidity and spindle capability.

- ※ Feed Rate2: Feed rate of approach and \*connection moves.  
\*Changing from one engagement point to the next.

- Note:
- This application requires a high cutting force. A machine with poor rigidity and high vibration is not recommended.
  - Allow sufficient machine and spindle warm-up time for stability and to remove any expansion of the main spindle before running the program.
  - Tool setting length should achieve the least possible overhang.
  - Avoid contact with the coated area of the shank. This will prevent tip vibration and tool jamming in the collet / holder.
  - Run-out and vibration should be checked dynamically at the tool point while mounted in the machine and both should achieve the lowest level possible.
  - Use an inclined or helical approach (Recommended inclination angle: <5 degree).
  - Decrease both spindle speed and feed rate proportionally.
  - Air blow is highly recommended for longer tool life. Both oil mist and oil coolant are alternatives.
  - Recommend water soluble coolant for Hard Brittle (Non-Metallic) Materials.
  - When milling some work pieces, heavier chips may be created. To evacuate these chips it is important to accurately position the coolant nozzle on the milling part.
  - Remove chips to prevent heat generation and ignition during milling process.
  - Protective gear, such as safety glasses and face guards are required when milling.
  - Chips / dust generated while milling can have adverse affects on the machine parts if they are not properly evacuated. Take steps to assure proper evacuation.

\* Hard Brittle (Non-Metallic) Materials: Ceramics (Alumina, Zirconia, etc.), Glasses and etc.

## Features

**Long life Long Neck Ball End Mills for milling Cemented Carbide.**  
**High-level treatment to reduce cutting resistance and minimize damage on cutting edge.**  
**Wear resistance improved drastically with optimized diamond coating.**  
**Best for roughing and semi-finishing.**

The shank taper angle shown is not an exact value and to avoid contact with the work piece, we recommend the user controls the precise value of this angle. Shank taper angle should not make contact with the work piece.

Label Sample

#001 φD1.989 R0.000/-0.002

Diameter and Ball R accuracy measurements are printed on the label to support High Precision milling.

### [UDC Milling Tips]

Tool life (= material removal volume) changes depending on the difference in Cemented Carbide material. Recommend to select a material with good workability while considering the required performance (mold life).

| Cemented Carbide | TAS Standard | Density g/cm <sup>3</sup> | Hardness HRA | Flexural Strength MPa | Compressive Strength MPa | Co Amount* % | Grain Size $\mu\text{m}$ |
|------------------|--------------|---------------------------|--------------|-----------------------|--------------------------|--------------|--------------------------|
| ①                | VF-20        | 14.1                      | 92.5~93      | 4,500~5,000           | —                        | 12           | 0.5                      |
| ②                | VM-40        | 14.7                      | 90           | 3,240                 | 4,700                    | 8.8          | 2~3                      |

These milling parameters are based on VF-20, VM-40, VC-70, VU-70 (TAS standard) for Cemented Carbide, and Alumina for Hard Brittle Materials. These are for reference only. Tool life may differ depending on the type of Cemented Carbide / Hard Brittle Materials. For best result, fine parameter adjustments may be required, depending on the materials of Cemented Carbide / Hard Brittle Materials; milling shape and strategy; machine rigidity and spindle capability.

**Note:**

- This application requires a high cutting force. A machine with poor rigidity and high vibration is not recommended.
- Allow sufficient machine and spindle warm-up time for stability and to remove any expansion of the main spindle before running the program.
- Tool setting length should achieve the least possible overhang.
- Avoid contact with the coated area of the shank.  
This will prevent tip vibration and tool jamming in the collet / holder.
- Run-out and vibration should be checked dynamically at the tool point while mounted in the machine and both should achieve the lowest level possible.
- Use an inclined or helical approach (Recommended inclination angle: <5 degree).
- Decrease both spindle speed and feed rate proportionally.
- Air blow is highly recommended for longer tool life. Both oil mist and oil coolant are alternatives.
- Recommend water soluble coolant for Hard Brittle (Non-Metallic) Materials.
- When milling some work pieces, heavier chips may be created. To evacuate these chips it is important to accurately position the coolant nozzle on the milling part.
- Remove chips to prevent heat generation and ignition during milling process.
- Protective gear, such as safety glasses and face guards are required when milling.
- Chips / dust generated while milling can have adverse affects on the machine parts if they are not properly evacuated. Take steps to assure proper evacuation.
- The tool life may shorten due to a large difference between the commanded feed speed and the actual machining speed caused by factors as machining model and machining machine.
- Decrease both feed rate and feed rate 2 proportionally.
- Tool damage may progress rapidly near the end of the tool life.

\* Hard Brittle (Non-Metallic) Materials: Ceramics (Alumina, Zirconia, etc.), Glasses and etc.

## Features

Long Neck Ball type End Mills for milling Cemented Carbide and Hard Brittle (Non-Metallic) Materials. Upgraded version of UDCLB.

New Diamond coating and flute design increase material removal amount.

Chip pocket designed on tool tip improves the surface finishing quality.

Special cutting edge treatment helps to avoid the edge chipping & level gap.

Recommended to use on semi-roughing & finishing process.

The shank taper angle shown is not an exact value and to avoid contact with the work piece, we recommend the user controls the precise value of this angle. Shank taper angle should not make contact with the work piece.

Label Sample

#001 φD0.389 R0.000/-0.004

Diameter and Ball R accuracy measurements are printed on the label to support High Precision milling.

These milling parameters are based on VF-20, VM-40, VC-70, VU-70 (TAS standard) for Cemented Carbide, and Alumina for Hard Brittle Materials. These are for reference only.

Tool life may differ depending on the type of Cemented Carbide / Hard Brittle Materials.

For best result, fine parameter adjustments may be required, depending on the materials of Cemented Carbide / Hard Brittle Materials; milling shape and strategy; machine rigidity and spindle capability.

\* Feed Rate2: Feed rate of approach and \*connection moves.

\*Changing from one engagement point to the next.

### Note:

- This application requires a high cutting force. A machine with poor rigidity and high vibration is not recommended.
- Allow sufficient machine and spindle warm-up time for stability and to remove any expansion of the main spindle before running the program.
- Tool setting length should achieve the least possible overhang.
- Avoid contact with the coated area of the shank. This will prevent tip vibration and tool jamming in the collet / holder.
- Run-out and vibration should be checked dynamically at the tool point while mounted in the machine and both should achieve the lowest level possible.
- Use an inclined or helical approach (Recommended inclination angle: <5 degree).
- Decrease both spindle speed and feed rate proportionally.
- Air blow is highly recommended for longer tool life. Both oil mist and oil coolant are alternatives.
- Recommend water soluble coolant for Hard Brittle (Non-Metallic) Materials.
- When milling some work pieces, heavier chips may be created. To evacuate these chips it is important to accurately position the coolant nozzle on the milling part.
- Remove chips to prevent heat generation and ignition during milling process.
- Protective gear, such as safety glasses and face guards are required when milling.
- Chips / dust generated while milling can have adverse affects on the machine parts if they are not properly evacuated. Take steps to assure proper evacuation.

**Features**

Long Neck Ball type End Mills for milling Cemented Carbide and Hard Brittle (Non-Metallic) Materials. Developed to give improved hardness and durability, new Diamond coating also has outstanding adhesion to the cutting tool. By combining the new coating with optimum cutting geometries, the tool "deep cuts" the work piece. Leaves a burr and pit free surface finish on semi-roughing & finishing process.

Label Sample

#001 φD1.985 R+0.001/-0.002

Diameter and Ball R accuracy measurements are printed on the label to support High Precision milling.

The shank taper angle shown is not an exact value and to avoid contact with the work piece, we recommend the user controls the precise value of this angle. Shank taper angle should not make contact with the work piece.

Unit (mm)

| Model Number    | Radius of Ball Nose R | Effective Length ℓ <sub>1</sub> | Effective Length by Inclined Angles |                 |                 |                 |                 |

These milling parameters are based on VF-20, VM-40, VC-70, VU-70 (TAS standard) for Cemented Carbide, and Alumina for Hard Brittle Materials. These are for reference only. Tool life may differ depending on the type of Cemented Carbide / Hard Brittle Materials. For best result, fine parameter adjustments may be required, depending on the materials of Cemented Carbide / Hard Brittle Materials; milling shape and strategy; machine rigidity and spindle capability.

※ Feed Rate2: Feed rate of approach and \*connection moves.  
\*Changing from one engagement point to the next.

Note:

- This application requires a high cutting force. A machine with poor rigidity and high vibration is not recommended.
- Allow sufficient machine and spindle warm-up time for stability and to remove any expansion of the main spindle before running the program.
- Tool setting length should achieve the least possible overhang.
- Avoid contact with the coated area of the shank. This will prevent tip vibration and tool jamming in the collet / holder.
- Run-out and vibration should be checked dynamically at the tool point while mounted in the machine and both should achieve the lowest level possible.
- Use an inclined or helical approach (Recommended inclination angle: <5 degree).
- Decrease both spindle speed and feed rate proportionally.
- Air blow is highly recommended for longer tool life. Both oil mist and oil coolant are alternatives.
- Recommend water soluble coolant for Hard Brittle (Non-Metallic) Materials.
- When milling some work pieces, heavier chips may be created. To evacuate these chips it is important to accurately position the coolant nozzle on the milling part.
- Remove chips to prevent heat generation and ignition during milling process.
- Protective gear, such as safety glasses and face guards are required when milling.
- Chips / dust generated while milling can have adverse affects on the machine parts if they are not properly evacuated. Take steps to assure proper evacuation.

## Features

**Long Neck Ball type End Mills for finishing of Cemented Carbide and Hard Brittle Materials.**  
 Provides excellent machined surface quality due to the sharp cutting edge and optimized edge treatment.  
 Maintains excellent dimensional accuracy for a long time due to the high contour accuracy of the cutting edge and the excellent wear resistance of diamonds.

Label Sample

#001  $\phi D1.002$  R0.504/0.502

Diameter and Ball R accuracy measurements are printed on the label to support high precision milling.

Be sure to confirm the interference between the inclined work piece and the shank part by actual measurement.

- Note:
- Use a machine with high accuracy for stable cutting.
  - Non-water soluble coolant recommended. Supply as a mist or external coolant. Take fire prevention precautions to avoid fire hazards caused by sparks igniting during machining or tool breakage.
  - Shorten overhang as much as possible.
  - Adjust cutting conditions as necessary as machine spec and other conditions may vary.
  - These cutting parameters show reference value. Adjust the cutting conditions to the desired machined surface finish.

※Additional model

**Features**

Long Neck Radius End Mills for milling Cemented Carbide & Hard Brittle (Non-Metallic) Materials.  
 Upgraded version of UDCLRS.  
 Improved Diamond coating and optimum cutting geometries will "deep cuts" the material with offering long tool life.  
 Special cutting edge treatment helps to avoid the edge chipping & level gap on the work piece.  
 Recommended to use on semi-roughing & finishing process.

Label Sample

#001  $\phi D1.990 R+0.001/-0.001$

Diameter and Corner R accuracy measurements are printed on the label to support High Precision milling.

The shank taper angle shown is not an exact value and to avoid contact with the workpiece, we recommend the user controls the precise value of this angle. Shank taper angle should not make contact with the work piece.

These milling parameters are based on VF-20, VM-40, VC-70, VU-70 (TAS standard) for Cemented Carbide, and Alumina for Hard Brittle Materials. These are for reference only. Tool life may differ depending on the type of Cemented Carbide / Hard Brittle Materials. For best result, fine parameter adjustments may be required, depending on the materials of Cemented Carbide / Hard Brittle Materials; milling shape and strategy; machine rigidity and spindle capability.

※Feed Rate2: Feed rate of approach and \*connection moves.

## Note:

- This application requires a high cutting force. A machine with poor rigidity and high vibration is not recommended.
- Allow sufficient machine and spindle warm-up time for stability and to remove any expansion of the main spindle before running the program.
- Tool setting length should achieve the least possible overhang.
- Avoid contact with the coated area of the shank. This will prevent tip vibration and tool jamming in the collet / holder.
- Run-out and vibration should be checked dynamically at the tool point while mounted in the machine and both should achieve the lowest level possible.
- Does not require to be slowed down in the approach sequence when slotting and side milling.
- Use an inclined or helical approach when Z-level milling (Recommended inclination angle: <1 degree).
- For flat and side milling, set the axial depth (a<sub>p</sub>) and radial depth (a<sub>e</sub>) to allow for the uncut material of the corner radius.
- Decrease both spindle speed and feed rate proportionally.
- Air blow is highly recommended for longer tool life. Both oil mist and oil coolant are alternatives.
- Recommend water soluble coolant for Hard Brittle (Non-Metallic) Materials.
- When milling some work pieces, heavier chips may be created. To evacuate these chips it is important to accurately position the coolant nozzle on the milling part.
- Remove chips to prevent heat generation and ignition during milling process.
- Protective gear, such as safety glasses and face guards are required when milling.
- Chips / dust generated while milling can have adverse affects on the machine parts if they are not properly evacuated. Take steps to assure proper evacuation.

**Features**

UDC offers excellent drilling performance on Cemented Carbide and Hard Brittle (Non-Metallic) Materials. Developed to give improved hardness and durability, the new Diamond coating also has outstanding adhesion to the cutting tool. By combining the new coating with optimum cutting geometries, the tool "deep cuts" the work piece. Leaves a burr and pit free surface finish whether roughing, semi-finishing or finishing.

Label Sample

#001 φD1.988 R+0.001/-0.001

Diameter and Corner R accuracy measurements are printed on the label to support High Precision milling.

The shank taper angle shown is not an exact value and to avoid contact with the work piece, we recommend the user controls the precise value of this angle. Shank taper angle should not make contact with the work piece.

Unit (mm)

| Model Number        | Outside Diameter φD | Corner Radius CR | Effective Length ℓ <sub>1</sub> | Effective Length by Inclined Angles |      |        |      |      |
|---------------------|---------------------|------------------|---------------------------------|-------------------------------------|------|--------|------|------|

These milling parameters are based on VF-20, VM-40, VC-70, VU-70 (TAS standard) for Cemented Carbide, and Alumina for Hard Brittle Materials. These are for reference only.

Tool life may differ depending on the type of Cemented Carbide / Hard Brittle Materials.

For best result, fine parameter adjustments may be required, depending on the materials of Cemented Carbide / Hard Brittle Materials; milling shape and strategy; machine rigidity and spindle capability.

※Feed Rate2: Feed rate of approach and \*connection moves.  
\*Changing from one engagement point to the next.

Technical Data

**Note:**

- This application requires a high cutting force. A machine with poor rigidity and high vibration is not recommended.
- Allow sufficient machine and spindle warm-up time for stability and to remove any expansion of the main spindle before running the program.
- Tool setting length should achieve the least possible overhang.
- Avoid contact with the coated area of the shank. This will prevent tip vibration and tool jamming in the collet / holder.
- Run-out and vibration should be checked dynamically at the tool point while mounted in the machine and both should achieve the lowest level possible.
- Does not require to be slowed down in the approach sequence when slotting and side milling.
- Use an inclined or helical approach when Z-level milling (Recommended inclination angle: <1 degree).
- For flat and side milling, set the axial depth (ap) and radial depth (ae) to allow for the uncut material of the corner radius.
- Decrease both spindle speed and feed rate proportionally.
- Air blow is highly recommended for longer tool life. Both oil mist and oil coolant are alternatives.
- Recommend water soluble coolant for Hard Brittle (Non-Metallic) Materials.
- When milling some work pieces, heavier chips may be created. To evacuate these chips it is important to accurately position the coolant nozzle on the milling part.
- Remove chips to prevent heat generation and ignition during milling process.
- Protective gear, such as safety glasses and face guards are required when milling.
- Chips / dust generated while milling can have adverse affects on the machine parts if they are not properly evacuated. Take steps to assure proper evacuation.

## High Efficiency

6 flutes, 10 flutes with a 40° helix angle help to reduce cutting load allowing for deep milling on axial depth.

$\phi 2 \sim \phi 4$   
6 Flutes

$\phi 6$   
10 Flutes

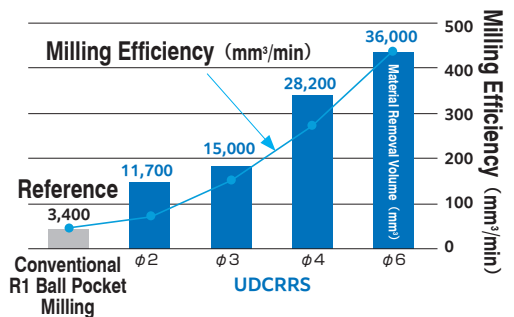

### Milling amount compared with 2 Flutes ( $\phi 2 \times EL 6$ )

Compared to a tool with 2 flutes, the  $a_p$  is 3 times and the  $a_e$  18 times higher in comparison. This shows a significant efficiency improvement.

### Cutting material removal volume for each size

Milling efficiency and material removal volume exceeds the conventional tool.

The shank taper angle shown is not an exact value and to avoid contact with the work piece, we recommend the user controls the precise value of this angle. Shank taper angle should not make contact with the work piece.

\*Set the feed rate of approach and connecting points (changing from one engagement point to the next) to 100 mm/min.

Roughing with UDCRRS

Finishing with UDC 2 Flutes

\*UDCRRS is designed for roughing, use other UDC 2 flutes when finishing.

These milling parameters are based on VF-20, VM-40, VC-70, VU-70 (TAS standard) for Cemented Carbide, and Alumina for Hard Brittle Materials. These are for reference only.

Tool life may differ depending on the type of Cemented Carbide / Hard Brittle Materials.

For best result, fine parameter adjustments may be required, depending on the materials of Cemented Carbide / Hard Brittle Materials; milling shape and strategy; machine rigidity and spindle capability.

## The best way to use UDCRRS for high efficiency and long tool life

### point1 Circular arc milling

**Circular arc milling** is recommended so the returning point is not an acute angle. This reduces cutting load on the peripheral cutting edge.

### point2 Chip evacuation

**Air blow coolant** is recommended. Recommended **spraying from multiple directions at high pressure** as much as possible.

Cemented Carbide Milling example of punching die

Technical Data

- Note:
- This application requires a high cutting force. A machine with poor rigidity and high vibration is not recommended.
  - Allow sufficient machine and spindle warm-up time for stability and to remove any expansion of the main spindle before running the program.
  - Tool setting length should achieve the least possible overhang.
  - Avoid contact with the coated area of the shank. This will prevent tip vibration and tool jamming in the collet / holder.
  - Run-out and vibration should be checked dynamically at the tool point while mounted in the machine and both should achieve the lowest level possible.
  - Decrease both spindle speed and feed rate proportionally.
  - Air blow is highly recommended for longer tool life. Both oil mist and oil coolant are alternatives.
  - Recommend water soluble coolant for Hard Brittle (Non-Metallic) Materials.
  - When milling some work pieces, heavier chips may be created. To evacuate these chips it is important to accurately position the coolant nozzle on the milling part.
  - Remove chips to prevent heat generation and ignition during milling process.
  - Protective gear, such as safety glasses and face guards are required when milling.
  - Chips / dust generated while milling can have adverse affects on the machine parts if they are not properly evacuated. Take steps to assure proper evacuation.
  - The tool life may shorten due to a large difference between the commanded feed speed and the actual machining speed caused by factors as machining model and machining machine.
  - Tool damage may progress rapidly near the end of the tool life.

## Features

**Long Neck Radius End Mills for finishing of Cemented Carbide and Hard Brittle Materials.**  
 Provides excellent machined surface quality due to the sharp cutting edge and optimized edge treatment.  
 Maintains excellent dimensional accuracy for a long time due to the high contour accuracy of the cutting edge and the excellent wear resistance of diamonds.

Label Sample

#001  $\phi D 0.499$  R0.049/0.048

Diameter and Ball R accuracy measurements are printed on the label to support high precision milling.

Be sure to confirm the interference between the inclined work piece and the shank part by actual measurement.

- Note:
- Use a machine with high accuracy for stable cutting.
  - Non-water soluble coolant recommended. Supply as a mist or external coolant. Take fire prevention precautions to avoid fire hazards caused by sparks igniting during machining or tool breakage.
  - Shorten overhang as much as possible.
  - Adjust cutting conditions as necessary as machine spec and other conditions may vary.
  - These cutting parameters show reference value. Adjust the cutting conditions to the desired machined surface finish.

## Cemented Carbide UPDLRS Milling Example for Finishing UDCLRSF / UPDLRS $\phi 2$ VF-20 (92.5HRA)

Milling Area :  $4 \times 10 \times$  Depth 1.8 mm

Work Size :  $10 \times 10 \times 20$  mm

After Finishing

| Milling Process    | Tool  | Spindle Speed (min <sup>-1</sup> ) | Feed Rate (mm/min) | $a_p$ (mm)           | $a_e$ (mm) | Stock (mm) | Coolant  | Cycle Time |

\* Hard Brittle (Non-Metallic) Materials: Ceramics (Alumina, Zirconia, etc.), Glasses and etc.

### Features

UDC offers excellent drilling performance on Cemented Carbide and Hard Brittle (Non-Metallic) Materials. By combining the new coating with optimum tool geometry, the tool improves hole quality and longer tool life. Makes mechanical drilling cost competitive!

| UDCMX 2700-250 | 7                    | 25                     | 80                  | 8                          | 52,000                      | 4,000                                 | 12.4                  | Single-Shot         |

These milling parameters are based on VM-40 (TAS standard) and are for reference only.

Tool life may differ depending on the type of Cemented Carbide material.

For best results, fine parameter adjustments may be required, depending on the Carbide material; milling shape and strategy; machine rigidity and spindle capability.

Technical Data

**Note:**

- Allow sufficient machine and spindle warm-up time for stability and to remove any expansion of the main spindle before running the program.
- Tool setting length should achieve the least possible overhang.
- Avoid contact with the coated area of the shank. This will prevent tip vibration and tool jamming in the collet / holder.
- Run-out and vibration should be checked dynamically at the tool point while mounted in the machine and both should achieve the lowest level possible.
- Recommend shallower drilling than flute length to promote good chip evacuation.
- Recommend using peck drilling cycle, but single-shot drilling may extend the tool life in some cases.
- Recommend air blow.
- Recommend water soluble coolant for Hard Brittle (Non-Metallic) Materials.
- Remove chips to prevent heat generation and ignition during milling process.
- Protective gear, such as safety glasses and face guards are required when milling.
- Chips / dust generated while milling can have adverse affects on the machine parts if they are not properly evacuated. Take steps to assure proper evacuation.
- Peck drilling is required depending on the hole quality & hole-edge chipping.
- We recommend to avoid operating the machine unattended when using large size tools with high MRR (Material Removal Rate) per hole. Rapid tool wear, sudden tool damage or breakage might occur depending on the processing environment.
- When milling some work pieces, heavier chips may be created.  
To evacuate these chips it is important to accurately position the coolant nozzle on the milling part.

\* Hard Brittle (Non-Metallic) Materials: Ceramics (Alumina, Zirconia, etc.), Glasses etc.

## Features

**Thread Mills for Cemented Carbide and Hard Brittle (Non-Metallic) Materials.**  
**Direct milling offers higher efficiency and precision comparing to EDM and grinding process.**  
**Developed to give improved hardness and durability, UDC also has outstanding adhesion to the tool.**  
**UDC series End Mills and Drills are recommended to drill holes before threading.**

The shank taper angle shown is not an exact value and to avoid contact with the work piece, we recommend the user controls the precise value of this angle. Shank taper angle should not make contact with the work piece.

\* Revised and reduced the spindle speed and feed rate for better tool life.

\* These milling parameters are based on VM-40 (TAS standard) and are for reference only.

Tool life may differ depending on the type of Cemented Carbide material.

For best results, fine parameter adjustments may be required, depending on the Carbide material; milling shape and strategy; machine rigidity and spindle capability.

### Note:

- This application requires a high cutting force. A machine with poor rigidity and high vibration is not recommended.
- Use a machine equipped with helical interpolating functions.
- Allow sufficient machine and spindle warm-up time for stability and to remove any expansion of the main spindle before running the program.
- Tool setting length should achieve the least possible overhang.
- Avoid contact with the coated area of the shank. This will prevent tip vibration and tool jamming in the collet / holder.
- Run-out and vibration should be checked dynamically at the tool point while mounted in the machine and both should achieve the lowest level possible.
- Decrease both spindle speed and feed rate proportionally.
- The feed rate is measured at the center of the tool.
- The radial cutting depth is recommended to cut all at once. Do not cut several times.
- Adjust turning radius amount to meet required internal thread precision.
- Air blow is highly recommended for longer tool life. Both oil mist and oil coolant are alternatives.
- Recommend water soluble coolant for Hard Brittle (Non-Metallic) Materials.
- When milling some work pieces, heavier chips may be created. To evacuate these chips it is important to accurately position the coolant nozzle on the milling part.
- Remove chips to prevent heat generation and ignition during milling process.
- Protective gear, such as safety glasses and face guards are required when milling.
- Chips / dust generated while milling can have adverse affects on the machine parts if they are not properly evacuated. Take steps to assure proper evacuation.

## New standard for Cemented Carbide Processing

- Cracks are minimized.
- Time and cost savings comparing to EDM process.
- Highly precise thread geometry generated by single path threading.

### CBN-LBSF For super surface finish

A cutting edge is set at the tip of the tool (zero peripheral speed).  
Improved finishing surface by the burnishing effect on relief.

### CBN-LBF For long tool life

Non helix angle design ensures high rigidity.

Radius

## Tool features of Radius type

### CBN-RSF For super surface finish

1 flute design enables an even milling amount and prevents chip biting caused by runout.  
The tool relief rubs against the milling surface to create a burnished finish.

Technical Data

## Features

1. CBN material featuring very high wear resistance.
2. Burnishing effect enables super mirror milling!
3. The slot design that allows coolant to reach the cutting edge.  
Chip evacuation effect offers long tool life.  
Prevention of repetitive chip cutting offers uniform milling surfaces.

Label Sample

Ball Radius accuracy measurements are printed on the label to support High Precision milling.

The shank taper angle shown is not an exact value and to avoid contact with the work piece, we recommend the user controls the precise value of this angle. Shank taper angle should not make contact with the work piece.

Tool shape

Length of cut

The length of cut that is 1.2 times the ball radius enables finishing on vertical surfaces.

Note:

- Decrease both spindle speed and feed rate proportionally when the milling parameters exceed the machine's maximum spindle speed.
- Recommend oil mist to avoid tool damage.

## CBN-LBF/CBN-LBSF Surface roughness comparison

### 2 Flutes R0.5 × EL1.5

STAVAX (52HRC)

CBN-LBSF  
For super surface  
Ra 0.033 μm

CBN-LBF  
For long tool life  
Ra 0.159 μm

Size : 55 × 25 × 23 mm  
Coolant : Oil mist

| Spindle Speed (min <sup>-1</sup> ) | Feed Rate (mm/min) | a <sub>p</sub> (mm) | a <sub>e</sub> (mm) | Cycle Time (h:m) |
|------------------------------------|--------------------|---------------------|---------------------|------------------|
| 36,000                             | 600                | 0.003               | 0.008               | 2:17             |

CBN-LBSF is recommended for excellent milling surface.  
The surface finish is of such high quality that the letters reflect perfectly in it.

## Note:

- Decrease both spindle speed and feed rate proportionally when the milling parameters exceed the machine's maximum spindle speed.
- Recommend oil mist to avoid tool damage.

Label Sample

#001  $\phi$  D0.600 R+0.003/0.000

Diameter and Ball Radius accuracy measurements are printed on the label to support High Precision milling.

The shank taper angle shown is not an exact value and to avoid contact with the work piece, we recommend the user controls the precise value of this angle. Shank taper angle should not make contact with the work piece.

## Features

For long tool life  
Various lineup from R0.05 to R2.

Tool center line

Non helix angle design ensures high rigidity.

## Note:

- Decrease both spindle speed and feed rate proportionally when the milling parameters exceed the machine's maximum spindle speed.
- Recommend oil mist to avoid tool damage.

Label Sample

#001  $\phi D0.998$  R+0.001/0.000

Diameter and Corner R accuracy measurements are printed on the label to support High Precision milling.

The shank taper angle shown is not an exact value and to avoid contact with the work piece, we recommend the user controls the precise value of this angle. Shank taper angle should not make contact with the work piece.

## Features

The tool relief rubs against the milling surface to create a burnished finish. 1 flute design enables an even milling amount and prevents chip biting caused by runout.

**The cutting edge at the tip point has a burnishing effect. (ELMAX 60HRC)**  
The unique design on the tool relief offers a shiny surface finish.

## Note:

- Decrease both spindle speed and feed rate proportionally when the milling parameters exceed the machine's maximum spindle speed.
- Recommend oil mist to avoid tool damage.

Label Sample

#001  $\phi D0.997$  R+0.001/0.000

Diameter and Corner R accuracy measurements are printed on the label to support High Precision milling.

The shank taper angle shown is not an exact value and to avoid contact with the work piece, we recommend the user controls the precise value of this angle. Shank taper angle should not make contact with the work piece.

## Features

Various lineup from  $\phi 0.1$  to  $\phi 3$

## CBN-LRF2000/4000 Common features

### Feature 1 High rigidity cutting edge

Super negative rake angle from the cutting edge at the tip point to peripheral cutting edge. Less damage when milling hard materials.

### Feature 2 Sharp cutting edge

The cutting edge is outstandingly sharp even with the super negative rake angle.

## Fuel cell separator mold

### 2 Flutes CBN-LRF $\phi 1 \times CR0.1 \times EL1$

## Note:

- Decrease both spindle speed and feed rate proportionally when the milling parameters exceed the machine's maximum spindle speed.
- Recommend oil mist to avoid tool damage.

Label Sample

#001  $\phi D1.999 R+0.001/0.000$

Diameter and Corner R accuracy measurements are printed on the label to support High Precision milling.

The shank taper angle shown is not an exact value and to avoid contact with the work piece, we recommend the user controls the precise value of this angle. Shank taper angle should not make contact with the work piece.

## Features

4-flute shape withstands high efficiency milling.  
Milling time can be significantly reduced compared to 2-flute.

## CBN-LRF2000/4000 Common features

**Feature 1** High rigidity cutting edge

Super negative rake angle from the cutting edge at the tip point to peripheral cutting edge.  
Less damage when milling hard materials.

**Feature 2** Sharp cutting edge

The cutting edge is outstandingly sharp even with the super negative rake angle.

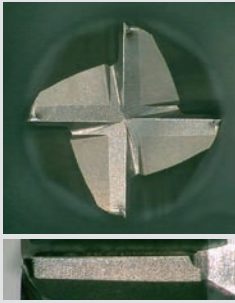

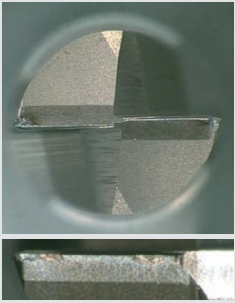

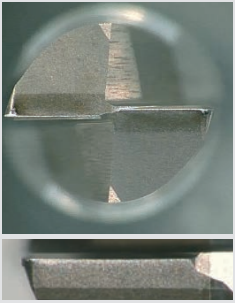

**Pocket milling**

| Milling results    | Mill under higher efficiency conditions than 2-flute. Greatly shortens milling time. | Large damage under the same milling conditions as 4-flute.                        | When the feed per tooth is the same, the damage is small, but the milling time is about twice as long. |

 $a_e$  : 0.08 mm

**Achieves high-speed milling that exceeds conventional CBN end mills even for small diameters.**  
 $\phi 0.3$  can be used in a machining center equipped with a 30,000 min<sup>-1</sup> spindle. It is recommended to decrease both spindle speed and feed rate proportionally.

**Note:**

- Decrease both spindle speed and feed rate proportionally when the milling parameters exceed the machine's maximum spindle speed.
- Recommend oil mist to avoid tool damage.

### Unique Cross Section design

New flute shape → Higher rigidity and better chip evacuation  
 Larger cross section → More resistance to breakage and wearing

The shank taper angle shown is not an exact value and to avoid contact with the work piece, we recommend the user controls the precise value of this angle. Shank taper angle should not make contact with the work piece.

## Milling Conditions for CSS

Note:

- Decrease both spindle speed and feed rate proportionally in case of chattering.
- These milling parameters are calculated based on the shortest overhang length. Longer overhangs may require an adjustment to the milling parameters.
- Reduce the milling amount and feed rate in accordance with required milling precision.
- Recommend water soluble or oil coolant.
- Recommend oil coolant for Titanium Alloys and Heat Resistant Alloys.

## Unique Cross Section design

## Milling Example: Slotting Comparison

|               |                            |
|---------------|----------------------------|
| Tool          | $\phi 6 \times L12$ mm     |
| Spindle Speed | 1,100 min <sup>-1</sup>    |
| Feed Rate     | 40 mm/min                  |
| $a_p$         | 1.8 mm                     |
| Coolant       | Air Blow (Through Spindle) |
| Cycle Time    | 28 min                     |

Technical Data

## Features

Broad application range from Copper and Carbon Steels up to Hardened Steels (55HRC).  
 Excellent performance/quality to price ratio.  
 Refer to page 194 for 4 flute C-CES.

The shank taper angle shown is not an exact value and to avoid contact with the work piece, we recommend the user controls the precise value of this angle. Shank taper angle should not make contact with the work piece.

| 45HRC or above                | $a_p=1D$<br>$a_e=0.05D$  | $a_p=1.5D$<br>$a_e=0.03D$ | $a_p=2D$<br>$a_e=0.02D$   | $a_p=3D$<br>$a_e=0.01D$   |

D : Outside Diameter (mm)

Ex.) 2D or below : Flute Length = Diameter  $\times$  2 or below

Note:

- Recommend water soluble or oil coolant.
- Recommend oil coolant for Titanium Alloys and Heat Resistant Alloys.

## Features

2 flute C-CES with a sharp corner design.

Broad application range from Copper and Carbon Steels up to Hardened Steels (55HRC).

Excellent performance/quality to price ratio.

Refer to page 200 for 4 flute C-CES-S.

The shank taper angle shown is not an exact value and to avoid contact with the work piece, we recommend the user controls the precise value of this angle. Shank taper angle should not make contact with the work piece.

## Milling Conditions for C-CES-S (2 Flutes)

Milling amount for slotting (mm)  
 $D < \phi 1$

| Work Material  | Length of Cut |               |
|----------------|---------------|---------------|
|                | 2D or below   | 3D or below   |
| 45HRC or below | $a_p = 0.1D$  | $a_p = 0.05D$ |
| 45HRC or above | $a_p = 0.02D$ | $a_p = 0.01D$ |

$\phi 1 \leq D < \phi 3$

| Work Material  | Length of Cut |                |
|----------------|---------------|----------------|
|                | 2D or below   | 3D or below    |
| 45HRC or below | $a_p = 0.25D$ | $a_p = 0.125D$ |
| 45HRC or above | $a_p = 0.05D$ | $a_p = 0.02D$  |

$\phi 3 \leq D$

| Work Material  | Length of Cut |               |
|----------------|---------------|---------------|
|                | 2D or below   | 3D or below   |
| 45HRC or below | $a_p = 0.5D$  | $a_p = 0.3D$  |
| 45HRC or above | $a_p = 0.05D$ | $a_p = 0.02D$ |

Milling amount for side milling (mm)

| Work Material  | Length of Cut                |                               |
|----------------|------------------------------|-------------------------------|
|                | 2D or below                  | 3D or below                   |
| 45HRC or below | $a_p = 1.5D$<br>$a_e = 0.1D$ | $a_p = 2.5D$<br>$a_e = 0.05D$ |
| 45HRC or above | $a_p = 1D$<br>$a_e = 0.05D$  | $a_p = 2D$<br>$a_e = 0.02D$   |

D : Outside Diameter (mm)

Ex.) 2D or below : Flute Length = Diameter  $\times$  2 or below

Note:

- Recommend water soluble or oil coolant.
- Recommend oil coolant for Titanium Alloys and Heat Resistant Alloys.

## Features

CrN COAT offers longer tool life.  
 Special geometry designed for Copper offers excellent milling performance.  
 Refer to page 232 for 4 flute CRN-ES.  
 Diameter Tolerance: 0/-0.02 ( $D \leq 6$ ), 0/-0.03 ( $D \geq 8$ )

The shank taper angle shown is not an exact value and to avoid contact with the work piece, we recommend the user controls the precise value of this angle. Shank taper angle should not make contact with the work piece.

#### Note:

- Decrease both spindle speed and feed rate proportionally in case of chattering.
- Adjust the milling amount and feed rate in accordance with required precision.
- Recommend water soluble or oil coolant.
- Recommended for Pure Copper. Not suitable for Tungsten Copper.

## Features

Diamond coated 2 Flute Square End Mills for Graphite Electrodes.

New Diamond coating, with a highly adhesive base layer, offers excellent wear resistance and longer tool life. Refer to page 234 for 4 flute DCES.

The shank taper angle shown is not an exact value and to avoid contact with the work piece, we recommend the user controls the precise value of this angle. Shank taper angle should not make contact with the work piece.

## Features

Medium length of cut design for Plastic milling.

Original flute design offers excellent surface finish.

Length of cut = outside diameter x3 (Note: outside diameter x1.5~2 is partially included).

Provides excellent milling surface for long overhang milling on Plastics.

The shank taper angle shown is not an exact value and to avoid contact with the work piece, we recommend the user controls the precise value of this angle. Shank taper angle should not make contact with the work piece.

Milling Amount for Slotting (mm)

## CPS finishing conditions for side milling

Refer to the slotting parameters for spindle speed and feed rate.  
Set the milling amount as below during side milling finishing.

Milling Amount for Side Finishing (mm)

$a_e$  : 0.01 ~ 0.015D (Min 0.01 mm)

D : Outside Diameter (mm)

## Note:

- Control the radial depth ( $a_e$ ) by approximately 0.01-0.015 times of the outside diameter or set to 0.01 mm the minimum during side milling finishing.
- Increase the feed rate per flute to reduce burring on surface of softer materials.
- Chattering may occur when using a spindle with low rigidity or when milling unstable work piece. Reduce the milling amount in this case.
- Recommend to reduce the milling amount when using a machine with low spindle speed. Not recommend to reduce the feed rate.
- Adjust the milling parameters based on the overhang length.
- Recommend water soluble coolant for Aluminum Alloys and Copper.
- Recommend air blow for Plastics.
- Remove chips from the work piece to keep the milling surface quality.
- If chips clog on the tool, stop the operation and remove them accordingly.
- Straight shank type (2030SS, 2030SSL, 2040SS, 2040SSL, etc.) has smaller outside diameter than shank diameter. Prevent the shank making contact with the work piece.

**Features**

Designed especially for Aluminum milling.

45° helix angle design offers excellent cutting performance and outstanding chip evacuation.

The shank taper angle shown is not an exact value and to avoid contact with the work piece, we recommend the user controls the precise value of this angle. Shank taper angle should not make contact with the work piece.

D : Outside Diameter (mm)

#### Note:

- Recommend using a non-contact measuring device to avoid damaging the sharp corner.
- Recommend side milling for finishing.
- Recommend water soluble coolant.

## Features

**Broad application range from Copper and Carbon Steels up to Hardened Steels (55HRC).  
Excellent performance/quality to price ratio.  
Refer to page 166 for 2 flute C-CES.**

The shank taper angle shown is not an exact value and to avoid contact with the work piece, we recommend the user controls the precise value of this angle. Shank taper angle should not make contact with the work piece. Actual measurement is necessary when using longer length of cut than the written length.

## Features

4 flute C-CES with a sharp corner design.  
 Broad application range from Copper and Carbon Steels up to Hardened Steels (55HRC).  
 Excellent performance / quality to price ratio.  
 Refer to page 180 for 2 flute C-CES-S.

The shank taper angle shown is not an exact value and to avoid contact with the work piece, we recommend the user controls the precise value of this angle. Shank taper angle should not make contact with the work piece.

The shank taper angle shown is not an exact value and to avoid contact with the work piece, we recommend the user controls the precise value of this angle. Shank taper angle should not make contact with the work piece. Actual measurement is necessary when using longer length of cut than the written length.

**Drilling and Milling in a Single Tool! 1/2 Cycle Time!**

**Drilling and Milling in a Single Tool**

**The unique design of the bottom edge offers the drilling process with 4 flutes**

## Milling Conditions for CZS

Slotting

D : Outside Diameter (mm)

Side Milling

**Note:**

- Decrease both spindle speed and feed rate proportionally when the milling parameters exceed the machines maximum speed, or when the tool is chattering and heats up to a red color.
- These milling parameters are calculated based on the shortest overhang length. Longer overhangs may require an adjustment to the milling parameters.
- Reduce the milling amount and feed rate in accordance with required milling precision.
- Spindle rigidity should be considered when setting milling parameters, especially for Z-Axis drilling.
- When slotting, using Z-Axis drilling, the milling parameters should promote good chip evacuation.
- Reduce the milling amount when chips clog on the tool during Z-Axis drilling.
- The milling parameter of outside diameter 16 and 20 is calculated based on BT50 spindle type. Decrease 50% milling amount for BT40 spindle type.
- Recommend water soluble or oil coolant.
- Recommend water soluble coolant (through spindle type) for Stainless Steels and Aluminum Alloys.
- Recommend oil coolant for Titanium Alloys and Heat Resistant Alloys.

**Features**

Variable Division & Helix design minimizes vibration and chattering.  
 Selected high toughness and chip resistant carbide material.  
 Optimized flute design offers outstandingly high efficiency milling and fine finishing.  
 Low friction coating resulting in excellent chip evacuation and resistance to wear.

The shank taper angle shown is not an exact value and to avoid contact with the work piece, we recommend the user controls the precise value of this angle. Shank taper angle should not make contact with the work piece. Actual measurement is necessary when using longer length of cut than the written length.

**Note:**

- Decrease both spindle speed and feed rate proportionally in case of chattering.
- These milling parameters are calculated based on the shortest overhang length. Longer overhangs may require an adjustment to the milling parameters.
- Reduce the milling amount and feed rate in accordance with required milling precision.
- Every coolant offers stable milling.
- Recommend water soluble or oil coolant for Stainless Steels and Copper.

## Features

**4 Flute Highly Efficient Square End Mills for stainless steels.**  
**Variable pitch & variable helix designed for milling stainless steels offers higher efficiency milling.**  
**New coating 'UTSCOAT' with excellent adhesion offers high resistance to breakage.**

The shank taper angle shown is not an exact value and to avoid contact with the workpiece, we recommend the user controls the precise value of this angle. Shank taper angle should not make contact with the work piece.

## Design features

Variable pitch & variable helix designed for milling stainless steels.

- Minimizes chattering
- Stable milling under highly efficient conditions

## Features of UTSCOAT

Improve the resistance to adhesion by adding a highly lubricant layer onto the high hardness and high toughness UTSCOAT.

- Reduce adhesion
- High resistance to breakage with high lubricity

#### Note:

- Decrease both spindle speed and feed rate proportionally in case of chattering.
- These milling parameters are calculated based on the shortest overhang length. Longer overhangs may require an adjustment to the milling parameters.
- Reduce the milling amount and feed rate in accordance with required milling precision.
- Every coolant offers stable milling.
- Recommend water soluble or oil coolant for Stainless Steels.

## Features

CrN COAT offers longer tool life.  
 Special geometry designed for Copper offers excellent milling performance.  
 Refer to page 186 for 2 flute CRN-ES.  
 Diameter Tolerance:  $0/-0.02(D \leq 6)$ ,  $0/-0.03(D \geq 8)$

The shank taper angle shown is not an exact value and to avoid contact with the work piece, we recommend the user controls the precise value of this angle. Shank taper angle should not make contact with the work piece.

### Side Milling

D : Outside Diameter (mm)

#### Note:

- Decrease both spindle speed and feed rate proportionally in case of chattering.
- Adjust the milling amount and feed rate in accordance with required precision.
- Recommend water soluble or oil coolant.
- Recommended for Pure Copper. Not suitable for Tungsten Copper.

## Milling Example $\phi 6$

## Pure Copper C1100

### CRN-ES $\phi 6 \times L24$

### 4 flute Square for Steels $\phi 6 \times L24$

## Features

Diamond coated 4 flute square end mills for Graphite Electrodes.

New diamond coating with a highly adhesive base layer offers excellent wear resistance and longer tool life.

Refer to page 188 for 2 flute DCES.

The shank taper angle shown is not an exact value and to avoid contact with the work piece, we recommend the user controls the precise value of this angle. Shank taper angle should not make contact with the work piece.

Milling Amount for side milling (mm)

$$a_p = 0.5D$$

$$a_e = 0.05D$$

D : Outside Diameter (mm)

Note:

- Use a milling machine dedicated for Graphite.
- Recommend air blow for Graphite.

### Other series for Graphite milling

### Features

Offering outstanding tool life by selecting appropriate 3, 4 or 6 flutes on each tool diameter.

Highly efficient milling on hard materials up to 65HRC with HARDMAX COAT.

The shank taper angle shown is not an exact value and to avoid contact with the work piece, we recommend the user controls the precise value of this angle. Shank taper angle should not make contact with the work piece.

## Chip color : Selection example of optimal milling conditions from the viewpoint of cutting heat

SKH51 (63HRC)

- Work size : 50 × 50 × 30 mm
- Coolant : Air blow (Through spindle)

Climb up milling by Square end mills

### What is climb up milling?

A milling method that makes effective use of the length of cut to make a large Z-cut in the first shot, and then runs up step by step.

### 1. Check the chip color under 6 types of conditions

|             | Spindle Speed (min <sup>-1</sup> ) | Feed Rate (mm/min) | $a_p$ (mm) | $a_e$ (mm) | Feed per tooth (mm/t) | Chip color | Result | Efficiency (mm <sup>3</sup> /min) |
|-------------|------------------------------------|--------------------|------------|------------|-----------------------|------------|--------|-----------------------------------|
| Condition 1 | 4,000                              | 1,350              | 10         | 0.15       | 0.056                 | Dark Blue  | ×      | 2,025                             |
| Condition 2 | 3,000                              | 1,000              | 10         | 0.15       | 0.056                 | Red Gold   | ✓      | 1,500                             |
| Condition 3 | 2,000                              | 675                | 10         | 0.15       | 0.056                 | Gold       | ✓      | 1,013                             |
| Condition 4 | 2,000                              | 675                | 20         | 0.2        | 0.056                 | Red Gold   | ✓      | 2,700                             |
| Condition 5 | 2,000                              | 1,000              | 20         | 0.2        | 0.083                 | Red Gold   | ✓      | 4,000                             |
| Condition 6 | 2,000                              | 1,000              | 20         | 0.4        | 0.083                 | Dark Blue  | ×      | 8,000                             |

### 2. Relationship between chip color and cutting heat

### 3. Optimal cutting condition

Condition 5 is judged to be the optimum condition based on the chip color and processing efficiency. No damage due to chipping of tools after 1 hour roughing process.

Note:

- Recommend down cut processing.
- Reduce cutting amount, feed rate, and apply zero-cut in accordance with required surface quality.
- Recommend air blow or oil mist.

## Features

**HARDMAX coating and optimized tool design control tool chipping.**  
**Longer tool life with deep rib milling on hard materials.**  
**High Accuracy: Diameter Tolerance: 0/-0.01 ( $D \leq 0.15$ ), 0/-0.015 ( $D \geq 0.2$ )**  
**Refer to page 288 for 4 flute HLS.**

The shank taper angle shown is not an exact value and to avoid contact with the work piece, we recommend the user controls the precise value of this angle. Shank taper angle should not make contact with the work piece.
