- Technical Data

- Note:
- Decrease the feed rate more than 50% from the milling parameters when slot milling.
  - Decrease both spindle speed and feed rate proportionally when the milling parameters exceed the machines maximum speed, or when the tool is chattering and heats up to a red color.
  - Every coolant offers stable milling.

## Wear Comparison HGLB R1 × EL6

## HAP72 (69HRC)

Tools after milling

Conventional

HGLB

### HGLB mills twice as efficiently as the conventional tool.

| Tool          | Conventional   | HGLB 2020-060            |
|---------------|--|--------------------------|
| Spindle Speed | 9,200 min <sup>-1</sup>                                | 12,250 min <sup>-1</sup> |
| Feed Rate     | 900 mm/min   | 1,800 mm/min             |
| $a_p$         | 0.06 mm  |                          |

The shank taper angle shown is not an exact value and to avoid contact with the workpiece, we recommend the user controls the precise value of this angle. Shank taper angle should not make contact with the work piece.

## ◆ Variable rake angle design

Optimized rake angles are designed from the ball tip to the peripheral cutting edge.

### Tip point

Negative rake angle design prevents fracture and chipping.

### Peripheral cutting edge

Slightly negative rake angle design reduces cutting resistance and prevents chattering.

## ◆ High Accuracy

Even higher accuracy than our conventional tools!

# New coating HMWCOAT

New coating that is best suited for around 60HRC.

## Ultra-high hardness layer

Nano-laminated structure prevents peeling and cracking on high hardness layer.

## Shock absorption layer

Nanocomposite structure offers both hardness and toughness.

## Higher hardness and toughness than conventional coating

Improved wear resistance compared to HARDMAX coating for milling around 60HRC.

### How to find the best coating for your steel applications

## Milling example R0.5 × EL2

SKD11 (60HRC)

### HWLB

### Conventional tool

|               |                                    |
|---------------|------------------------------------|
| Spindle Speed | 24,000 min <sup>-1</sup>           |
| Feed Rate     | 2,000 mm/min                       |
| $a_p$         | 0.1 mm                             |
| $a_e$         | 0.3 mm                             |
| Coolant       | Air Blow                           |
| Milling Shape | Square Pocket<br>118 × 16 × 0.9 mm |
| Cycle Time    | 32 min                             |

HWLB shows little wear on the relief and face.

## Note:

- Decrease the feed rate more than 50% from the milling parameters when slot milling.
- Decrease both spindle speed and feed rate proportionally when the milling parameters exceed the machine's maximum spindle speed, or when chattering and red-hot occur.
- Every coolant offers stable milling.

### Features

- Variable rake angle design**  
Optimized rake angles are designed from the ball tip to the peripheral cutting edge.
- HARDMAX coating**  
HARDMAX coating offers heat resistance, durability and lubricity at a high level.
- Suitable for various coolant types.**  
Every coolant offers stable milling.

The shank taper angle shown is not an exact value and to avoid contact with the work piece, we recommend the user controls the precise value of this angle. Shank taper angle should not make contact with the work piece.

- Note:
- Decrease the feed rate more than 50% from the milling parameters when slot milling.
  - Decrease both spindle speed and feed rate proportionally when the milling parameters exceed the machine's maximum speed, or when the tool is chattering and heats up to a red color.
  - Every coolant offers stable milling.

### Features

- 1 Short shank for high accuracy shrink-fit holder.
- 2 Variable rake angle design Optimized rake angles are designed from the ball tip to the peripheral cutting edge.
- 3 HARDMAX Coating HARDMAX coating offers heat resistance, durability and lubricity at a high level.
- 4 Suitable for various coolant types. Every coolant offers stable milling.

The shank taper angle shown is not an exact value and to avoid contact with the work piece, we recommend the user controls the precise value of this angle. Shank taper angle should not make contact with the work piece.

### Short overhang length with short shank length!

Short overhang length minimizes tool run-out

- High precision milling
- Minimizes chattering
- Longer tool life

Ideal for tool holders where the maximum insertion is short.

### Tighter Tolerance Design! Diameter Tolerance, Ball Radius Accuracy, and Shank Diameter Tolerance

HSB / HSLB Tolerance

| Radius of Ball Nose | Diameter Tolerance | Ball Radius Accuracy | Shank Diameter Tolerance |
|---------------------|--------------------|----------------------|--------------------------|

| Feed rate ratio                      | 100%                | 75%                 | 66%                 | 50%                 | 50%                 |

※ A is based on the catalog milling conditions.

| Milling condition A | Milling condition B | Milling condition C | Milling condition D<br>Good | Milling condition E<br>Excellent |
|---------------------|---------------------|---------------------|-----------------------------|----------------------------------|
|                     |                     |                     |                             |                                  |

Test A ~ D) Compared milling surfaces with 4 different feed rates and the spindle speed of 8,400 min<sup>-1</sup>.

Result . . . The milling surface improved with **reduced feed per tooth**.

Test E) Tested with the double spindle speed of 16,800 min<sup>-1</sup>.

Result . . . The milling surface improved even more (Ra 0.17 μm) with **increased spindle speed**.

Milling condition E was applied to another work.

### 3 features of CSELB

Reduce cutting resistance and prioritize surface quality.

Recommended for milling on hardened steels (55HRC) - sticky materials, materials that prone to chatter marks.

Less resistance on curved surface shape

Small relief surface

Tip design with excellent cutting performance

## Wheel shape

PX5 (30HRC)

Work size  
100 × 100 × 30mm

Coolant: Water soluble

## Tool

2 flute ball  
**CSEB** (P432)

2 flute long neck ball  
**CSELB**

4 flute highly efficient radius  
**CRRS** (P390)

Spiral V Cutter

Drill

Technical Data

**Note:**

- Decrease the feed rate more than 50% from the milling parameters when slot milling.
- Decrease both spindle speed and feed rate proportionally when the milling parameters exceed the machines maximum speed, or when the tool is chattering and heats up to a red color.
- Recommend oil coolant for Stainless Steels and Heat Resistant Alloys.
- Recommend wet coolant for Copper.

**Features**

**Diamond coated 2 flute long neck ball end mills for Graphite Electrodes.**

**A highly adhesive coating base, offers long tool life and excellent wear resistance.**

The shank taper angle shown is not an exact value and to avoid contact with the work piece, we recommend the user controls the precise value of this angle. Shank taper angle should not make contact with the work piece.

## Note:

- Use a milling machine dedicated for Graphite.
- Decrease the feed rate more than 50% from the milling parameters when slot milling.
- Recommend air blow for Graphite.

Technical Data

Label Sample

#001 φD0.597 R+0.001/-0.001

Diameter and Ball Radius accuracy measurements are printed on the label to support High Precision milling.

The shank taper angle shown is not an exact value and to avoid contact with the work piece, we recommend the user controls the precise value of this angle. Shank taper angle should not make contact with the work piece.

## Note:

- Decrease the feed rate more than 50% from the milling parameters when slot milling.
- Decrease both spindle speed and feed rate proportionally when the milling parameters exceed the machine's maximum spindle speed, or when chattering occurs.
- Recommend wet coolant for Copper and Tungsten-Copper.

Tools after milling

DLCLB series Introduction Video

DLCLB series Housing-rib Electrode Milling Video

DLCLB has less wear and damage after 4 hours of milling, and enables stable milling throughout the long cycle time.

## DLCLB Milling example

## Copper Tungsten (Cu30 : W70)

Work Size : 50 x 50 x 50 mm  
Coolant : Oil Mist

Total 12:03:22

DLC coating offers high wear resistance and is suited even for copper tungsten that is hard to mill.

## DLCLB Milling example

## Aluminum A7075

Work Size : 50 x 50 x 50 mm  
Coolant : Water Soluble

Reflection of the background

The surface finish is of such high quality that the letters reflect perfectly in it.

Surface roughness

Average of 3 positions  
 $R_a$  0.03  $\mu$ m

Suited even for Aluminum milling as the cutting edge is sharper than normal endmills for steels.

**Features**

Long neck ball design for milling Plastics.  
Designed especially for deep rib milling using an undercut form.

The shank taper angle shown is not an exact value and to avoid contact with the work piece, we recommend the user controls the precise value of this angle. Shank taper angle should not make contact with the work piece.

Slotting

Note:

- Adjust the axial depth ( $a_p$ ) based on the effective length and milling condition.
- Recommend water soluble coolant for Aluminum Alloys and Copper.
- Recommend air blow for Plastics.
- Remove chips from the work piece to keep the milling surface quality.
- If chips clog on the tool, stop the operation and remove them accordingly.

The shank taper angle shown is not an exact value and to avoid contact with the work piece, we recommend the user controls the precise value of this angle. Shank taper angle should not make contact with the work piece.

**Features**

Suited for various heat-resistant alloys including Titanium and Inconel due to large pocket, variable pitch and high lubricity coating.  
Tip slot design offers clean milling surfaces even for Copper, Aluminum and Acrylic.

Copper C1100

Acrylic

Aluminum A7075

**3 series of tip slot ball**

Raw materials 40 50 55 60 65 Hardness (HRC)

**CFB** 3 flute ball, Flute design: Positive  
**CFLB** 3 flute long neck ball

**HFB** 4 flute ball, Flute design: Negative

3 flute ball CFB series (P442) and 4 flute ball HFB series for hard materials (P452) are also available.

Note:

- Decrease the feed rate more than 50% from the milling parameters when slot milling.
- Decrease both spindle speed and feed rate proportionally when the milling parameters exceed the machines maximum speed, or when the tool is chattering and heats up to a red color.
- Recommend wet coolant for Copper.
- DRY: air blow, WET: water soluble or oil coolant.

## Features

Taper Neck design offers high rigidity.  
 Stable milling and excellent surface even on deep milling.  
 HARDMAX coat offers heat resistance, toughness and lubricity at a high level.  
 Suitable for hard materials up to 65HRC.

The shank taper angle shown is not an exact value and to avoid contact with the work piece, we recommend the user controls the precise value of this angle. Shank taper angle should not make contact with the work piece.

Unit (mm)

## Note:

- Decrease both spindle speed and feed rate proportionally when the milling parameters exceed the machine's maximum spindle speed.
- The neck length and taper angle may affect the milling parameters. In operation, fine adjustments may be required.
- Recommend air blow or oil mist.
- Recommend oil coolant for Stainless Steels and Heat Resistant Alloys.
- Recommend water soluble or oil base coolant for Copper.

## Features

**2 Flute Diamond coated Taper Neck Ball End Mills for Graphite Electrodes.**  
**Taper Neck design improves the tool rigidity and provides high-efficiency & high-precision milling.**  
**Original and optimized Diamond coating offers outstanding resistance to wear on Graphite.**  
**Excellent adhesion coating with long-life tool design.**

The shank taper angle shown is not an exact value and to avoid contact with the work piece, we recommend the user controls the precise value of this angle. Shank taper angle should not make contact with the work piece.

## Note:

- Use a milling machine dedicated for Graphite.
- Decrease the feed rate more than 50% from the milling parameters when slot milling.
- Recommend air blow for Graphite.

## Other series for Graphite milling

## Square / Long Neck Square

## Features

**3 Flute Taper Neck Ball End Mills for Hard Materials.**

**The negative rake angle design improves wear resistance.**

**Back taper design reduces cutting resistance.**

**Suitable for both roughing and finishing. Diameter Tolerance : 0/-0.015.**

Shape A

Shape B

The shank taper angle shown is not an exact value and to avoid contact with the work piece, we recommend the user controls the precise value of this angle. Shank taper angle should not make contact with the work piece.

- **Variable Pitch design**  
Minimizing vibration and chattering

※ Variable Pitch  $\alpha \neq \beta \neq \gamma$

- **A wide choice of Taper Neck Angles**

Useful sizes:  $0.4^\circ \cdot 0.9^\circ \cdot 1.4^\circ \cdot 1.9^\circ \cdot 2.9^\circ$

Using with HTNRS, Taper Neck Radius End Mill, offers higher efficient milling.

Refer to page 412 for HTNRS.

Note:

- Decrease both spindle speed and feed rate proportionally when the milling parameters exceed the machine's maximum spindle speed.
- Decrease the feed rate more than 50% from the milling parameters when slot milling.
- Every coolant offers stable milling.

Roughness Comparison

HFTNB R1 × Neck Length 20 × Neck Taper Angle 0.4° SKD61 (48HRC)

Work Size : 30 x 50 x 40 mm

| Measurement Spot | Surface Roughness Ra (μm) |            |
|------------------|---------------------------|------------|
|                  | HFTNB                     | Competitor |

## Taper Pocket Milling Examples

HFTNB R1 × Neck Length 30 × Neck Taper Angle 0.9°

SKD61 (50HRC)

3 Flutes

Milling Shape : Taper Pocket 25 x 5 x Depth 4 mm Wall Inclined Angle 1°

Tools after milling

**HFTNB**

After 40 min

After 120 min

**Normal wear condition after 120 min milling. No chipping or any damages.**

Competitor A  
After 40 min

Chipping on the cutting edges of all 3 flutes after 40 min.

Competitor B  
After 40 min

Large chipping on the cutting edge after 40 min. Chipping also on the other 2 flutes.

**High durability throughout the long cycle time.**

Milling Amount for Side Milling(mm)

$\ell$  = Length of Cut

$\Delta t = \tan \text{Half Included Taper Angle} \times 0.9 \ell$

Note:

- Recommend water soluble or oil coolant.
- Recommend wet coolant for Copper.

**Features**

Broad range of application available with UTCOAT.  
Suitable for narrow interference area with small inclined angle.

Technical Data

**Features**

Broad range of application available with UTCOAT.  
Suitable for finishing on flat surface with wide taper angle.

**Features**

Spiral type chamfering cutter.

Half included angle  $45^\circ$ .

By applying a spiral peripheral cutting edge, burrs are greatly reduced when compared to a straight cutting edge design.

Milling Amount (mm)

$$a_p = 0.1D$$

 $a_p$  : Axial Depth (mm)

Note:

- The figures listed above are for nominal diameters. Adjust the speed and feed rate according to the correct diameter.
- Recommend slot milling with the tip flutes. Decrease the feed rate 50% from the milling parameters in this case.
- Recommend water soluble or oil coolant.

Technical Data

**Features**

Available to a wide variety of applications by the 180° point angle.  
 The helix angle of 30° offers excellent chip evacuation, stable and highly efficient pilot hole drilling.  
 New web-thinning design for improved chip evacuation and sharpness.  
 Double-margin will guide the tool into inner wall and achieve high-straightness drilling to non-planar surface.  
 Size M4 - M12 for drilling pilot holes before tapping.

| Outside Diameter      | Diameter Tolerance(h8) |
|-----------------------|------------------------|
| $\phi D \leq 3$       | 0/-0.014               |
| $3 < \phi D \leq 6$   | 0/-0.018               |
| $6 < \phi D \leq 10$  | 0/-0.022               |
| $10 < \phi D \leq 12$ | 0/-0.027               |

**Feature1 : Helix angle 30°**

Excellent chip evacuation with 30° helix angle

**Feature2 : Double-margin**

Double-margin

High-straightness drilling

**Feature3 : A wide variety of applications**

Flat surface

Inclined surface

Designed for drilling on flat, inclined or curved surfaces.

Note:

- These milling parameters are for reference only.
- Adjust the parameters in accordance with the machine rigidity, workpiece clamping condition and shape.
- Recommend water soluble or oil coolant.
- Step milling is recommended in case of clogging.

**UTDF Inclined Surface Drilling Example** **SS400**  
 $\phi 3.5 \times$  Flute Length 14 mm (Prototype)

Coolant : Water Soluble (Nozzle)  
 Work Size : 40 × 75 × 60 mm

Each hole after drilling  
**Excellent drilling performance with less burrs.**

## Features

A highly efficient and economic drill for both mass and prototype production of parts.  
 UT MICRO COAT offers excellent performance for cutting soft materials.  
 The new drill design and X thinning offer stable drilling performance with increased tool life.  
 The 130° point angle ensures reduced burring of the drilled hole.  
 The high rigidity short flute is perfect for high accuracy drilling and pilot hole drilling.

Diameter Tolerance: 0/-0.01 mm  
 Point Angle: 130°

- Note:
- Recommend shallower drilling than flute length (under  $\phi$  1:1D,  $\phi$  1 and over: 0.5D).
  - Recommend water soluble or oil coolant.
  - Recommend oil coolant for Titanium Alloys and Heat Resistant Alloys.

### Note:

- Recommend step amount 0.1D-0.2D. Recommend 0.2D-0.5D for Aluminum Alloys.
- Recommend water soluble or oil coolant.
- Recommend oil coolant for Titanium Alloys and Heat Resistant Alloys.

Drilling Example 1

SUS304

**Comments**

● Tip Damage:

Damage by chipping can be seen on the Carbide Drill. The High-Speed Steel Drill exhibits wear on the top chisel line and corners. The High-Speed Steel Drill also has the work material adhering to it.

● Hole Position:

The solid carbide drill has minimal deflection when compared to a High Speed steel model, through the entire drilling cycle.

### Features

A highly efficient and economic drill for both mass and prototype production of parts.

UT MICRO COAT offers excellent performance for cutting soft materials.

The new drill design and X thinning offer stable drilling performance with increased tool life.

The 130° point angle ensures reduced burring of the drilled hole.

With an aspect ratio of 15:1, the drill is ideal for deep hole drilling, that requires high accuracy.

Diameter Tolerance: 0/-0.01 mm  
Point Angle: 130°

Note:

- Apply pre-drilling more than 3D depth before deep drilling. Recommend UTDSX for pre-drilling.
- Recommend shallower drilling than flute length (under  $\phi$  1:1D,  $\phi$  1 and over: 0.5D).
- Recommend water soluble or oil coolant.
- Recommend oil coolant for Titanium Alloys and Heat Resistant Alloys.

## Comparison of UTD (Carbide) and HSS Drill Bit SUS420J2 (Raw Material)

UTD can drill more than 2X holes compared to an HSS model

|               |  |
|---------------|--|
| Tool Size     | φ1.32 × 12 UTD proto type              |
| Spindle Speed | 5,000 min <sup>-1</sup> (Vc: 21 m/min) |
| Feed Rate     | 200 mm/min (f: 0.04 mm/rev.)           |
| Peck Amount   | 1.3 mm                                 |
| Depth         | 7 mm blind hole                        |

### UTD prototype

### HSS Drill (Company A: φ3 shank diameter with TIN coating for SUS)

Flank wear comparison with HSS

## Drilling test with various materials (Comparison of with / without thinning)

Smooth chip evacuation using the X-thinning design, offers greater resistance to breakage and more accurate drilling

Drill Size : φ1.0 x 15  
 Tool : UTDLX 2100-150 (with thinning)  
 Test Tool: φ1.0 x 15 (without thinning)

|               |  |
|---------------|--|
| Spindle Speed | 9,500 min <sup>-1</sup> (Vc: 30 m/min) |
| Feed Rate     | 400 mm/min (f: 0.042 mm/rev.)          |
| Peck Amount   | 0.2 mm                                 |
| Depth         | 14 mm blind hole                       |

|               |   |
|---------------|---|
| Spindle Speed | 15,900 min <sup>-1</sup> (Vc: 50 m/min) |
| Feed Rate     | 1,500 mm/min (f: 0.094 mm/rev.)         |
| Peck Amount   | 0.7 mm                                  |
| Depth         | 14 mm blind hole                        |

|               |  |
|---------------|--|
| Spindle Speed | 6,400 min <sup>-1</sup> (Vc: 20 m/min) |
| Feed Rate     | 150 mm/min (f: 0.023 mm/rev.)          |
| Peck Amount   | 0.2 mm                                 |
| Depth         | 14 mm blind hole                       |

Technical Data

# OPTECH-MES/MES-D50

## Non-contact dynamic run out measurement of the tool with Micro Eyes !

### Features

- Diameter & Run-out detection improves the milling quality and stability.**  
 Allowing the process to operate at the optimum condition by controlling the Machine spindle & tool setting.
- Prevents problems with tool life by detecting the tool tip.**  
 Detects tool damage & wear on micro tools.
- Price cut from the conventional product.**  
 Priced below the current OPTECH-Me/EDR-D20 measuring device.

### Measuring example

## Calculation of Milling Conditions

Proper tool selection, machine condition, feed and speeds are essential for successful milling. The optimum machining conditions are calculated using the formulas below.

### Formulas for calculation of end milling conditions

1. Velocity :  $V_C$  (m/min)

$$V_C = \frac{\pi \times D \times n}{1000}$$

$\pi = 3.14$  (Circular Constant)  
 $D =$  Outside Diameter (mm)  
 $n =$  Spindle Speed ( $\text{min}^{-1}$ )

2. Spindle Speed :  $n$  ( $\text{min}^{-1}$ )

$$n = \frac{1000 \times V_C}{\pi \times D}$$

$V_C =$  Velocity (m/min)  
 $\pi = 3.14$  (Circular Constant)  
 $D =$  Outside Diameter (mm)

3. Feed Rate :  $V_f$  (mm/min)

$$V_f = n \times z \times f_z$$

$n =$  Spindle Speed ( $\text{min}^{-1}$ )  
 $z =$  Number of flutes  
 $f_z =$  Feed per tooth (mm/t)

4. Feed per tooth :  $f_z$  (mm/t)

$$f_z = \frac{V_f}{n \times z}$$

$V_f =$  Feed Rate (mm/min)  
 $n =$  Spindle Speed ( $\text{min}^{-1}$ )  
 $z =$  Number of flutes

### Explanation of terms used in parameters

1. Velocity  $V_C$  [Unit: m/min] :

The milling distance of an optional point on the circumference per unit (1 minute)

Related Value —  $\left\{ \begin{array}{l} \text{Diameter } \phi D \text{ [mm]} : \text{ Twice the distance from the center of a circle (radius)} \\ \pi : \text{ Circular constant} = 3.14 \text{ (Unit : Nil)} \\ \text{Spindle Speed } n \text{ [min}^{-1}\text{]} : \text{ Revolutions per minute} \\ \text{[min}^{-1}\text{]} = \text{[rpm ; revolutions per minute]} \end{array} \right.$

- Length of Circumference = Diameter  $\times$  pi :  $\pi D$  [mm]
- Velocity  $V_c$ : Milling length per minute = Length of circumference  $\times$  Spindle rotation speed

$$V_c = \pi \times D \text{ [mm]} \times n \text{ [min}^{-1}\text{]}$$

$$V_c = \frac{\pi \times D \text{ [mm]} \times n \text{ [min}^{-1}\text{]}}{1000} \text{ [m/min]}$$

Unit Conversion : 1 mm = 1/1000 m therefore....  
 $D \text{ [mm]} = D/1000 \text{ [m]}$

## 2. Feed per tooth $f_z$ [Unit:mm/t]

|               |   |  |   |
|---------------|---|--|---|
| Related Value | — | Feed Rate $V_f$ [mm/min]               | : Amount of feed per minute   |
|               |   | Spindle Speed $n$ [min <sup>-1</sup> ] | : Revolutions per minute<br>[min <sup>-1</sup> ] = [rpm ; revolutions per minute] |
|               |   | Number of Flutes $z$                   | : Number of flutes  |

- The amount of feed per rotation is described below. (rev = revolution)

$$f = \frac{V_f \text{ [mm/min]}}{n \text{ [rev/min]}} = \frac{V_f}{n} \left[ \frac{\text{mm}}{\text{min}} \right] \times \left[ \frac{\text{min}}{\text{rev}} \right]$$

$$= \frac{V_f}{n} \text{ [mm/rev]}$$

※ [min<sup>-1</sup>] = [rev/min]

- The amount of feed per flute is calculated using the feed rate divided by the number of flutes.

$$f_z = \frac{f \text{ [mm/rev]}}{z} = \frac{V_f}{n \times z} \text{ [mm/t]}$$

## Using the Parameter Chart

### example 1

<How to calculate spindle speed and feed rate >

For example: C-CES2080 NAK55 (39HRC) high speed milling

- (1) Determine the velocity  $V_c$  based on the type of work material or its hardness.  
Parameter chart on page 177 shows  $V_c=200$  m/min.
- (2) We know the Outside diameter, we can set spindle speed ( $n$ ) and feed rate ( $V_f$ ).  
NAK55 is in the Prehardened Steel column. Velocity  $V_c$  is 200 m/min.  
From the table, the Outside diameter (D) is 8.0 mm, then  
 $n = 7900 \text{ min}^{-1}$  and  $V_f = 405 \text{ mm/min}$ .
- (3) Set the Z-axis cutting depth to approximately half of the outside diameter.

### example 2

<How to calculate feed rate >

- Case 1. You want to work on S50C with a C-CES2030 End Mill, but the milling machine has  $3,500 \text{ min}^{-1}$  maximum Spindle capability only. What is the feed rate with the conditions given?

Based on a feed per tooth  $0.0135 \text{ mm/t}$

$$V_f : = (n \times z \times f_z) = (3,500 \times 2 \times 0.0135) = 94.5$$

$n$  : Spindle speed

$z$  : Number of flutes

$f_z$  : Feed per tooth

$$n = 3,500 \text{ min}^{-1}, V_f : = 94.5 \text{ mm/min.}$$

<How to calculate the spindle speed>

- Case 2. You want to work on NAK80 with a C-CES2100 End Mill at velocity  $22 \text{ m/min}$ . What is the spindle speed for this application?

$$n = \frac{1000 V_c}{\pi D} = \frac{1000 \times 22}{3.14 \times 10} = 700 \text{ min}^{-1}$$

- Case 3. Calculating the spindle speed when side milling using C-CTE 4100-3

Work material: Carbon Steel

Velocity :  $40 \text{ m/min}$ .

Outside Diameter D is calculated about  $1/3$  to  $1/2$  of cutting depth from bottom.

For example: If the blade length is  $35 \text{ mm}$ , cutting depth is  $18 \text{ mm}$ .

Outside Diameter  $D_1 = (1/3 \times \text{Axial Depth } a_p \times \tan(\text{half included angle})) \times 2 + \text{tip diameter}$

$$= (1/3 \times 18 \times \tan 1.5^\circ) \times 2 + \phi 10 \doteq 10.3$$

$$\text{Spindle speed } n = \frac{1000 V_c}{\pi D} = \frac{1000 \times 40}{3.14 \times 10.3} = 1,237 \text{ min}^{-1}$$

Technical Data

## Diagram of End Mill Virtual Diameter

Square type diameter equals to the virtual diameter.  
Ball type virtual diameter will vary depending on the contact point with work material and milling depth.  
The velocity of Ball End Mill can be calculated by using the virtual diameter.

Velocity of virtual diameter (V) can be calculated by the following formula.

$$V_C(\text{m/min}) = \pi \times \phi d (\text{mm}) \times n (\text{min}^{-1}) / 1000$$

Ex.) With virtual diameter  $\phi 1$  mm and spindle speed 30,000 ( $\text{min}^{-1}$ ),

$$V_C(\text{m/min}) \text{ is } ; V_C(\text{m/min}) = 3.14 \times \phi 1 (\text{mm}) \times 30,000 (\text{min}^{-1}) / 1000 = 94.2 \text{ m/min}$$

## End Mills' Production Flow

We can flexibly deal with highly accurate grinding and complicated shape machining using our in-house developed production facilities at Mitsuke Factory, our factory dedicated to end mill manufacturing, located in Niigata Prefecture. We also develop inspection equipment for various processes and precise radius measuring instruments for ball end mills internally under our strict quality control system.
