Side Milling

Slotting

D : Outside Diameter (mm)

## Note:

- Recommend using a non-contact measuring device to avoid damaging the precision tip point.
- Decrease both spindle speed and feed rate proportionally when the milling parameters exceed the machine's maximum spindle speed.
- Every coolant offers stable milling.
- Recommend oil coolant for Stainless Steels and Heat Resistant Alloys.
- Recommend wet coolant for Copper.

## Features

Long neck square end mill with a positive rake angle.

Best suited for Raw materials, Copper, SUS and materials 55HRC and below.

The shank taper angle shown is not an exact value and to avoid contact with the work piece, we recommend the user controls the precise value of this angle. Shank taper angle should not make contact with the work piece.

## Slotting

D : Outside Diameter (mm)

## Note:

- Decrease both spindle speed and feed rate proportionally when the milling parameters exceed the machine's maximum spindle speed.
- Recommend water soluble or oil coolant.
- Recommend oil coolant for Titanium Alloys and Heat Resistant Alloys.

**Features**

**2 Flute Diamond coated Long Neck Square End Mills for milling Graphite Electrodes.**  
 New diamond coating, with a highly adhesive base layer, offers excellent wear resistance and long tool life.

The shank taper angle shown is not an exact value and to avoid contact with the work piece, we recommend the user controls the precise value of this angle. Shank taper angle should not make contact with the work piece.

**Features**

Long Neck Square End Mills for milling Plastics.  
Designed especially for deep rib milling using an under cut design.

The shank taper angle shown is not an exact value and to avoid contact with the work piece, we recommend the user controls the precise value of this angle. Shank taper angle should not make contact with the work piece.

## Milling Amount for Slotting (mm)

$$a_e \leq 0.5D$$

D : Outside Diameter (mm)

## CPR Finishing Conditions for Side Milling

Refer to the slotting parameters for speeds and feeds.

Set the milling amount as below during side milling finishing.

## Milling Amount for Side Finishing (mm)

$$a_e : 0.01 \sim 0.015D \text{ (Min 0.01 mm)}$$

D : Outside Diameter (mm)

## Note:

- Control the radial depth (ae) by approximately 0.01-0.015 times of the outside diameter or set to 0.01 mm the minimum during side milling finishing.
- Increase the feed rate per flute to reduce burring on surface of softer materials.
- Chattering may occur when using a spindle with low rigidity or when milling unstable work piece. Reduce the milling amount in this case.
- Recommend to reduce the milling amount when using a machine with low spindle speed. Not recommend to reduce the feed rate.
- Recommend water soluble coolant for Copper and Aluminum Alloys.
- Recommend air blow for Plastics.
- Remove chips from the work piece to keep the milling surface quality.
- If chips clog on the tool, stop the operation and remove them accordingly.

## Features

Long Neck & Long Shank Square End Mills for milling Plastics.  
High performance for deep rib cut milling.  
Excellent cutting performance for milling Plastics.

The shank taper angle shown is not an exact value and to avoid contact with the work piece, we recommend the user controls the precise value of this angle. Shank taper angle should not make contact with the work piece.

Milling Amount for Slotting (mm)  
 $a_p \leq 0.5D$   
 D : Outside Diameter (mm)

CPRL Finishing Conditions for Side Milling  
 Refer to the slotting parameters for speeds and feeds.  
 Set the milling amount as below during side milling finishing.

Milling Amount for Side Finishing (mm)  
 $a_e : 0.01 \sim 0.015D$  (Min 0.01 mm)  
 D : Outside Diameter (mm)

## Milling Conditions for CPRL

- Note:
- Control the radial depth ( $a_p$ ) by approximately 0.01-0.015 times of the outside diameter or set to 0.01 mm the minimum during side milling finishing.
  - Increase the feed per tooth to reduce burr on surface of softer materials.
  - Chattering may occur when using a spindle with low rigidity or when milling unstable work piece. Reduce the milling amount in this case.
  - Recommend to reduce the milling amount when using a machine with low spindle speed. Not recommend to reduce the feed rate.
  - Recommend water soluble coolant for Copper and Aluminum Alloys.
  - Recommend air blow for Plastics.
  - Remove chips from the work piece to keep the milling surface quality.
  - If chips clog on the tool, stop the operation and remove them accordingly.

### CPR $\phi 1 \times$ EL6 Slotting Example

MC Nylon

|             | Spindle speed (min <sup>-1</sup> ) | Feed rate (mm/min) | $a_p$ (mm) | Feed per tooth (mm/t) |
|-------------|------------------------------------|--------------------|------------|-----------------------|
| Condition 1 | 6,000                              | 400                | 0.3        | 0.033                 |

## Features

- Capable of verical milling into a flat surface.
- Achieves shorter processing time by removing pre-drilling or ramping cycle.
- 45° helix angle offers excellent chip evacuation.
- The flute shape is specifically designed for reducing burrs on Aluminum Alloys.
- The micro flatland design greatly helps control of chipping.

The shank taper angle shown is not an exact value and to avoid contact with the work piece, we recommend the user controls the precise value of this angle. Shank taper angle should not make contact with the work piece.

### Diameter Tolerance

| Outside Diameter (φD)                         | Tolerance   |
|---|-------------|
| $\phi 1 \sim \phi 6, \phi 7, \phi 9, \phi 11$ | 0<br>-0.015 |
| $\phi 8, \phi 10, \phi 12$                    | 0<br>-0.005 |

#### Micro Flatland Design

Excellent sharpness + Chipping protection design

#### Smooth Flute Design

Outstanding chip evacuation by seamless flute.

#### 3 Flute Design

Highly efficient 3 flutes. Significant productivity improvement.

### ◆ Feed per tooth fixed at 0.05 mm/t. Comparison of burrs at different spindle speeds and feed rates.

|             | Spindle speed (min <sup>-1</sup> ) | Feed rate (mm/min) | Velocity (m/min) | $a_p$ (mm)   | Feed per tooth (mm/t) | Milling condition details   | Slot wall Down cut side  |
|-------------|------------------------------------|--------------------|------------------|--------------|-----------------------|---|--|
| Condition 1 | 13,000                             | 2,000              | 200              | 3.75 (0.75D) | 0.05                  | Spindle speed and feed rate = Catalogue milling conditions                | <br>Best result |
| Condition 2 | 11,700                             | 1,750              | 180              |              |                       | Spindle speed and feed rate = 10% lower than catalogue milling conditions |                 |
| Condition 3 | 10,000                             | 1,500              | 160              |              |                       | Spindle speed and feed rate = 25% lower than catalogue milling conditions | <br>Some burrs  |
| Condition 4 | 7,700                              | 1,150              | 120              |              |                       | Spindle speed and feed rate = 40% lower than catalogue milling conditions |                 |
| Condition 5 | 3,200                              | 480                | 50               |              |                       | Spindle speed and feed rate = 75% lower than catalogue milling conditions | <br>Most burrs |

No burrs under condition 1, catalogue milling conditions.

As the spindle speed was lowered, burrs began to appear, and the most burrs occurred at the velocity of 50 m/min in condition 5.

At the same feed per tooth, burrs were more likely to occur if the velocity was reduced too much.

### ◆ Spindle speed fixed at 10,000min<sup>-1</sup>. Comparison of burrs at different feed rates.

|             | Spindle speed (min <sup>-1</sup> ) | Feed rate (mm/min) | Velocity (m/min) | $a_p$ (mm)   | Feed per tooth (mm/t) | Milling condition details                                    | Slot wall Down cut side   |
|-------------|------------------------------------|--------------------|------------------|--------------|-----------------------|--|---|
| Condition 6 | 10,000                             | 2,000              | 160              | 3.75 (0.75D) | 0.07                  | Spindle speed 10,000min <sup>-1</sup><br>Feed per tooth +30% |  |
| Condition 7 |                                    | 2,400              |                  |              | 0.08                  | Spindle speed 10,000min <sup>-1</sup><br>Feed per tooth +60% |  |

At a fixed spindle speed of 10,000 min<sup>-1</sup>, burrs slightly increased compared to condition 3 when the feed rate was raised, but there was no significant difference.

## Features

- Capable of vertical milling directly into a plane surface.
- Achieves shorter processing time by removing pre-drilling or ramping cycle.
- DLC COAT offers excellent resistance to wear and welding.
- 45° helix angle offers excellent chip evacuation.
- The flute shape is specifically designed for reducing burrs on Aluminum Alloys.
- The micro flatland design greatly helps control of chipping.

The shank taper angle shown is not an exact value and to avoid contact with the work piece, we recommend the user controls the precise value of this angle. Shank taper angle should not make contact with the work piece.

### Diameter Tolerance

| Outside Diameter (φD)                         | Tolerance   |
|---|-------------|
| $\phi 1 \sim \phi 6, \phi 7, \phi 9, \phi 11$ | 0<br>-0.015 |
| $\phi 8, \phi 10, \phi 12$                    | 0<br>-0.005 |

- Note:
- Recommend using a non-contact measuring device to avoid damaging the sharp bottom corner.
  - Decrease both spindle speed and feed rate proportionally in case of chattering.
  - These milling parameters are calculated based on the shortest overhang length. Longer overhangs may require an adjustment to the milling parameters.
  - Reduce the milling amount and feed rate in accordance with required milling precision.
  - Spindle rigidity should be considered when setting milling parameters, especially for Z-Axis drilling.
  - When slotting, using Z-Axis drilling, the milling parameters should promote good chip evacuation.
  - Reduce the milling amount when chips clog on the tool during Z-Axis drilling.
  - Set axial depth ( $a_p$ ) to 1/3 ( $a_p=0.25D$ ) in the area closest to a vertical wall with more than 2D work depth.
  - These are milling parameters under the work material is firmly fixed. Decrease spindle speed and feed rate according to the condition.
  - Recommend water soluble coolant.

## Features

Feature1 : Variable pitch

$\theta_1 > \theta_2$  : The unequal division reduces chattering and tip damage.

$\theta_1 + \theta_2 = 180^\circ$  : Easy to measure diameter.

Feature2 : Back taper geometry

Back taper geometry reduces cutting force.

Feature3 : HARDMAX coating with high level of heat resistance, durability and lubrication.

Feature4 : Improved new 4 flute design offers improved chip evacuation and achieves high feed and milling precision.

The shank taper angle shown is not an exact value and to avoid contact with the work piece, we recommend the user controls the precise value of this angle. Shank taper angle should not make contact with the work piece.

Refer to page 242 for 2 flute HLS.

## Milling Conditions for HLS (4 Flutes)

Slotting

D : Outside Diameter (mm)

Side Milling

### Note:

- Recommend using a non-contact measuring device to avoid damaging the precision tip point.
- Decrease both spindle speed and feed rate proportionally when the milling parameters exceed the machine's maximum spindle speed.
- Every coolant offers stable milling.
- Recommend oil coolant for Stainless Steels and Heat Resistant Alloys.
- Recommend wet coolant for Copper.

**Features**

Variable Pitch & Helix design minimizes vibration and chattering.  
 Selected high toughness and chip resistant carbide material.  
 Optimized flute design offers outstanding high efficiency milling and fine finishing.  
 Low friction coating resulting in excellent chip evacuation and resistance to wear.

The shank taper angle shown is not an exact value and to avoid contact with the work piece, we recommend the user controls the precise value of this angle. Shank taper angle should not make contact with the work piece.

Contact our sales when milling hardened steels with L/D=5 or longer effective length tools.

**Note:**

- Decrease both spindle speed and feed rate proportionally in case of chattering.
- These milling parameters are calculated based on the shortest overhang length. Longer overhangs may require an adjustment to the milling parameters.
- Reduce the milling amount and feed rate in accordance with required milling precision.
- Every coolant offers stable milling.
- Recommend water soluble or oil coolant for Stainless Steels and Copper.

Cutting Load Comparison CXS  $\phi$  8

SKD61 (50HRC)

◆Milling Conditions

|               |                         |
|---------------|-------------------------|
| Spindle Speed | 4,200 min <sup>-1</sup> |
| Feed Rate     | 770 mm/min              |
| $a_p$         | 8 mm                    |
| $a_e$         | 0.3 mm                  |
| Coolant       | Water Soluble           |

Tool damage and surface quality will be influenced by the cutting load fluctuation range.

CXS has a small fluctuation range and the tool is hard to chatter.

**Features**

Various range of Corner Radius.

Broad application range from Copper and Carbon Steels up to Hardened Steels (55HRC).

The shank taper angle shown is not an exact value and to avoid contact with the work piece, we recommend the user controls the precise value of this angle. Shank taper angle should not make contact with the work piece.

## Features

4 flute high efficient corner radius designed for Titanium Alloys and Heat Resistant Alloys.  
 UTCOAT is recommended for heat-resistant hard materials to achieve longer tool life.  
 Variable pitch, high helix and positive rake angle offer stable milling.  
 Reduced cutting force when using a helical approach or inclined angles.

Please adjust milling parameters referring following table.

D :  $\phi 6 \sim \phi 12$

| Overhang Length | Spindle Speed (min <sup>-1</sup> ) | Feed Rate (mm/min) | a <sub>p</sub> Axial Depth (mm) | a <sub>e</sub> Radial Depth (mm) |
|-----------------|------------------------------------|--------------------|---------------------------------|----------------------------------|
| ~D×4            | ×1                                 | ×1                 | ×1                              | ×1                               |
| ~D×5            | ×0.7                               | ×0.7               | ×0.7                            | ×0.8                             |
| ~D×6            | ×0.5                               | ×0.5               | ×0.6                            | ×0.7                             |

Note:

- Decrease both spindle speed and feed rate proportionally when the milling parameters exceed the machine's maximum spindle speed.
- Recommend water soluble or oil coolant.

D : Outside Diameter (mm)

**Pocket Milling Example: Milling with CNRS  $\phi 10 \times CR2$**

**Ti6Al-4V (30HRC)**

**Stable milling on hard-to-cut materials**

| Spindle Speed                                 | Feed Rate                          | $a_p$  | $a_e$ | Overhang Length | Cycle Time | Coolant                         | Pocket Size     |
|---|------------------------------------|--------|-------|-----------------|------------|---------------------------------|-----------------|
| 1,820 min <sup>-1</sup><br>$V_c=$<br>57 m/min | 700 mm/min<br>$f_z=$<br>0.096 mm/t | 0.5 mm | 5 mm  | 45 mm (4.5D)    | 30 min     | Water Soluble (Through Spindle) | 70 × 44 × 13 mm |

**CNRS**

Continuous cutting is possible after 60 min milling.

**Competitor's Tool**

Corner radius is broken after 30min (one pocket) milling.

**Slotting Example: Milling with CNRS  $\phi 8 \times CR1$**

**Inconel718 (40HRC)**

## Features

Variable Division & Variable Helix design minimizes vibration and chattering.

Selected carbide material with high toughness & high chip resistance.

Excellent wear-resistance for the wide range of milling applications, from highly efficient milling to finishing.

Low friction coating resulting in excellent chip evacuation and resistance to wear.

Decreasing cutting resistance and offering stable milling by the original corner R design.

The shank taper angle shown is not an exact value and to avoid contact with the work piece, we recommend the user controls the precise value of this angle. Shank taper angle should not make contact with the work piece.

### Slotting

D : Outside Diameter (mm)

### Note:

- Decrease both spindle speed and feed rate proportionally in case of chattering.
- These milling parameters are calculated based on the shortest overhang length. Longer overhangs may require an adjustment to the milling parameters.
- Reduce the milling amount and feed rate in accordance with required milling precision.
- Every coolant offers stable milling.
- Recommend water soluble or oil coolant for Stainless Steels and Copper.

## Milling Conditions for CXERS

**Features**

Recommended on a wide range of materials – Carbon Steels and Hardened steels up to 55 HRC.  
Variable pitch & helix design and positive rake angle offer highly efficient side milling.  
Seamless corner radius design greatly reduces cutting force.

The shank taper angle shown is not an exact value and to avoid contact with the work piece, we recommend the user controls the precise value of this angle. Shank taper angle should not make contact with the work piece.

**Variable Pitch**

$\alpha \neq \beta \neq \gamma \neq \delta \neq \epsilon$

**Corner Radius Design**

**Variable Helix**

$\beta_1 \neq \beta_2$

Note:

- Please be sure to use water soluble coolant.
- These milling parameters are for reference only.
- For best result, fine parameter adjustments may be required, depending on the milling shape / application / machine used and so on.
- Decrease both spindle speed and feed rate proportionally when the milling parameters exceed the machine's maximum spindle speed.
- WARNING: Because of high material removal rate, you must pay attention to your chip and coolant management.

## 5 Flutes v.s. 4 Flutes Comparison of Cutting Chips

STAVAX (53HRC)

Size : 140 x 200 mm  
 Coolant : Oil Mist  
 Milling Method : Side Milling  
 Spindle Speed : 4,000 min<sup>-1</sup>  
 Feed Rate : 2,500 mm/min  
 $a_p$  : 20 mm  
 $a_e$  : 0.5 mm

### ◆ 5 Flute Radius $\phi 10 \times CR0.5 \times L20$

After 40 min

After 80 min

### ◆ 4 Flute Radius $\phi 10 \times CR1 \times L26$

After 40 min

### ◆ Comparison of Cutting Chips

**5 Flutes**  
 Uniform cutting chips

**4 Flutes**  
 Irregular size cutting chips

**5 flutes, variable pitch and variable helix design protect the tool from chattering and chipping under high-speed condition.**

## Features

**Radius End Mills for Hard Materials.**

**4 and 6 Flutes have been applied to suitable sizes to offer outstandingly long tool life.**

**HARDMAX coat enables highly efficient milling for 65HRC High Speed Steels.**

**Various Corner Radius sizes available.**

The shank taper angle shown is not an exact value and to avoid contact with the work piece, we recommend the user controls the precise value of this angle. Shank taper angle should not make contact with the work piece.

A lineup of 4 flutes and 6 flutes that considers high efficiency and chip evacuation performance according to the tool diameter.

$\phi 3 \sim \phi 5$  4 flutes

$\phi 6 \sim \phi 12$  6 flutes

Note:

- Recommend down cut processing.
- Reduce cutting amount, feed rate, and apply zero-cut in accordance with required surface quality.
- Recommend air blow or oil mist.

Side Milling

## Features

Long Neck Radius design for high efficiency and high quality milling.  
 Recommended for various applications from Copper and Raw Materials to Hard Materials.  
 Both dry and wet coolant offer stable and long tool life.  
 Refer to page 358 for 4 flute HLRS.

The shank taper angle shown is not an exact value and to avoid contact with the work piece, we recommend the user controls the precise value of this angle. Shank taper angle should not make contact with the work piece.

|                          | Diameter Tolerance | Corner Radius Tolerance    |
|--------------------------|--------------------|----------------------------|
| Standard Tolerance Type  | 0/-0.015           | Nominal Radius $\pm$ 0.005 |
| Excellent Tolerance Type | 0/-0.01            | Nominal Radius $\pm$ 0.005 |

Unit (mm)

| Model Number       | Excellent | Outside Diameter $\phi D$ | Corner Radius CR | Effective Length $\ell_1$ | Effective Length by Inclined Angles |      |       |      |      |
|--------------------|-----------|---------------------------|------------------|---------------------------|-------------------------------------|------|-------|------|------|

Side Milling

Note:

- Decrease both spindle speed and feed rate proportionally when the milling parameters exceed the machine's maximum spindle speed.
- Every coolant offers stable milling.
- Recommend oil coolant for Stainless Steels and Heat Resistant Alloys.
- Recommend wet coolant for Copper.

Technical Data

The shank taper angle shown is not an exact value and to avoid contact with the work piece, we recommend the user controls the precise value of this angle. Shank taper angle should not make contact with the work piece.

◆ **Super negative rake angle is best suited for 60-70 HRC as it greatly reduces the cutting resistance.**

◆ **High Precision Diameter Tolerance / Radius Accuracy / Shank Diameter Tolerance**

| HLRS Tolerance        |                    | Unit (mm)       |                          |

- Note:
- Decrease the feed rate more than 50% from the milling parameters when slot milling.
  - Decrease both spindle speed and feed rate proportionally when the milling parameters exceed the machine's maximum spindle speed, or when chattering and red-hot occur.
  - Every coolant offers stable milling.

## Features

Long Neck Radius design for high efficiency and high quality milling.  
 The rigid tool geometry offers longer tool life when milling Hard Materials.  
 HARDMAX coat is adopted which maintains heat resistance, toughness and lubricity at a high level.  
 Both dry and wet coolant offer stable and long tool life.  
 Refer to page 324 for 2 flute HLRS.

The shank taper angle shown is not an exact value and to avoid contact with the work piece, we recommend the user controls the precise value of this angle. Shank taper angle should not make contact with the work piece.

Unit (mm)

| Model Number      | Outside Diameter $\phi D$ | Corner Radius CR | Effective Length $l_1$ | Effective Length by Inclined Angles |      |       |      |      |      |
|-------------------|---------------------------|------------------|------------------------|-------------------------------------|------|-------|------|------|------|

## Side Milling

### Note:

- Decrease both spindle speed and feed rate proportionally when the milling parameters exceed the machine's maximum spindle speed.
- Every coolant offers stable milling.
- Recommend oil coolant for Stainless Steels and Heat Resistant Alloys.
- Recommend wet coolant for Copper.

Technical Data

## Feature 1 : Variable pitch

$\theta 1 > \theta 2$  : The unequal division reduces chattering and tip damage.  
 $\theta 1 + \theta 2 = 180^\circ$  : Easy to measure outside diameter.

## Feature 2 : Back taper geometry

The back taper geometry reduces cutting resistance, which enables stable milling on vertical walls.

## Milling Example for Deep Milling

HLRS4000  $\phi 2 \times \text{CR0.3} \times \text{EL16}$  ( $L / D = 8$ )

## Features

Special corner radius geometry offers greater milling amount and larger step over than a ball design. Seamless corner radius reduces cutting resistance and chattering. Suitable for milling hard materials up to 65HRC.

The shank taper angle shown is not an exact value and to avoid contact with the work piece, we recommend the user controls the precise value of this angle. Shank taper angle should not make contact with the work piece.

When using an effective length of 5D, or the protruding tool experiences an "overhang", then pay attention to the tool overhang coefficient below while referring to the milling parameter table.

\*Effective Length 5D: Effective Length (ℓ) ÷ Diameter (φD) = 5

D: φ2.0~3.0

| Overhang Length L/D | Spindle Speed (min <sup>-1</sup> ) | Feed Rate (mm/min) | Axial Depth (mm) | Radial Depth (mm) |
|---------------------|------------------------------------|--------------------|------------------|-------------------|
| ~φD×6               | ×1                                 | ×1                 | ×1               | ×1                |
| ~φD×7               | ×0.8                               | ×0.8               | ×0.8             | ×0.9              |
| ~φD×8               | ×0.7                               | ×0.7               | ×0.7             | ×0.9              |

When using an effective length of 5D, or the protruding tool experiences an "overhang", then pay attention to the tool overhang coefficient found on page 384 while referring to the milling parameter table.

\*Effective Length 5D: Effective Length ( $\ell_e$ ) ÷ Diameter ( $\phi D$ ) = 5

Roughing Parameter

Finishing Parameter  
(Flat / Inclined Surface)

Note:

- Decrease both spindle speed and feed rate proportionally when the milling parameters exceed the machine's maximum spindle speed.
- Decrease the feed rate more than 50% from the milling parameters when slot milling.
- Only adjust the spindle speed when calculate milling conditions based on the overhang length in finishing process.
- Recommend air blow or oil mist.

## Features

Shorter overall length and overhang offer higher feed and precision.

Achieves larger step over by seamless corner radius design.

Rated to 65HRC milling. Refer to page 384, 385 for milling conditions.

The shank taper angle and the shank length (H) shown are not an exact value and to avoid contact with the work piece, we recommend the user controls the precise value of this angle. Shank taper angle should not make contact with the work piece.

**Excellent chipping resistance and surface quality !**

**Original corner radius design offers high rigidity and reduces cutting resistance.**

After milling SKD11 (60HRC)

**HRRS**

**Competitor**

**Competitor**

Seamless corner radius with equal rake angle design. Reduces the cutting resistance and offers excellent chip evacuation to protect from the tool damage.

Flat and non-helix gash design. Badly damaged at tip point where cutting chips are trapped by poor chip evacuation.

Flat and helical gash design. Huge tool damage at tangent point where the gash shape abruptly changed and cutting chips could not evacuate properly.

**Longer tool life with variable pitch design. Recommended for various coolant.**

## Features

Broad application range from Copper and Raw Materials to Hardened Steels (55HRC). UTCOAT offers long tool life. Variable pitch, high helix and positive rake angle offer stable milling. Reduced cutting resistance when using a helical approach or inclined angles.

The shank taper angle shown is not an exact value and to avoid contact with the work piece, we recommend the user controls the precise value of this angle. Shank taper angle should not make contact with the work piece.

| L/D = 5                | × 0.7                                 | × 0.6                 | × 0.6                        | × 0.8                         |
| L/D = 6                | × 0.5                                 | × 0.4                 | × 0.5                        | × 0.7                         |

### Note:

- Decrease both spindle speed and feed rate proportionally when the milling parameters exceed the machine's maximum spindle speed.
- Decrease the feed rate more than 50% from the milling parameters when slot milling.
- Only adjust the spindle speed to calculate milling conditions based on the overhang length in finishing process.
- Every coolant offers stable milling.
- Recommend wet coolant for Stainless Steels.

## CRRS $\phi 6 \times CR0.3$ Milling Example

Ti-6Al-4V

| Spindle Speed            | Feed Rate    | $a_p$   | $a_e$ | Cycle Time | Coolant                         |
|--------------------------|--------------|---------|-------|------------|---------------------------------|
| $7,150 \text{ min}^{-1}$ | 4,000 mm/min | 0.05 mm | 1 mm  | 67 min     | Water Soluble (Through-spindle) |

Square pocket size  $100 \times 25 \times 4 \text{ mm}$

No vibration and chattering. No burrs or chattering on workpiece. No tool damage and tool wear within normal range.

## CRRS $\phi 6 \times CR1.5$ Milling Example

Inconel718

| Spindle Speed            | Feed Rate  | $a_p$   | $a_e$  | Cycle Time | Coolant                         |
|--------------------------|------------|---------|--------|------------|---------------------------------|
| $1,740 \text{ min}^{-1}$ | 820 mm/min | 0.06 mm | 1.1 mm | 63 min     | Water Soluble (Through-spindle) |

Square pocket size  $40 \times 30 \times 3 \text{ mm}$

No vibration and chattering. No burrs or chattering on workpiece. Chipping on rake face due to wear on the bottom cutting edge. Acceptable given the 60min milling of Inconel.

## Features

**Diamond coated 4 Flute Long Neck Radius End Mills for Graphite Electrodes.**  
**Original diamond coating offers excellent resistance to wear on Graphite milling.**  
**Long life tool with optimized flute geometry and high adhesion diamond coating.**

The shank taper angle shown is not an exact value and to avoid contact with the work piece, we recommend the user controls the precise value of this angle. Shank taper angle should not make contact with the work piece.

## Features

Broad application range from Carbon Steels to Hardened Steels (55HRC).

Variable pitch, variable helix and positive rake angle design offers highly efficient side milling. Seamless Corner Radius design reduces cutting resistance.

The shank taper angle shown is not an exact value and to avoid contact with the work piece, we recommend the user controls the precise value of this angle. Shank taper angle should not make contact with the work piece.

### Variable Pitch

$$\alpha \neq \beta \neq \gamma \neq \delta \neq \epsilon$$

### Seamless Corner Radius

### Variable Helix

$$\beta_1 \neq \beta_2$$

Note:

- Please be sure to use water soluble coolant.
- These milling parameters are for reference only. For best result, fine parameter adjustments may be required, depending on the milling shape / application / machine and so on.
- Decrease both spindle speed and feed rate proportionally when the milling parameters exceed the machine's maximum spindle speed.
- WARNING: Because of high material removal rate, you must pay attention to your chip and coolant management.

## Features

Long Neck Radius design for milling on Hard Materials.  
The cutting edge is designed for offering high rigidity.

The shank taper angle shown is not an exact value and to avoid contact with the work piece, we recommend the user controls the precise value of this angle. Shank taper angle should not make contact with the work piece.

| Milling Amount (mm) |                       | $a_p$ : 0.02D<br>$a_e$ : 0.2D      |                    |            |            | $a_p$ : 0.02D<br>$a_e$ : 0.2D      |                    |            |            | $a_p$ : 0.02D<br>$a_e$ : 0.2D                       |                    |            |            |

**Note:**

- Decrease both spindle speed and feed rate proportionally when the milling parameters exceed the machines maximum speed, or when the tool is chattering and heats up to a red color.
- When milling on a side or bottom surface, set the  $a_p$  amount taking into consideration the remaining corner area.
- Recommend wet coolant for Stainless Steels.

D : Outside Diameter (mm)

The shank taper angle shown is not an exact value and to avoid contact with the work piece, we recommend the user controls the precise value of this angle. Shank taper angle should not make contact with the work piece.

**High efficiency**

Multi-flutes, variable pitch and a short length of cut are some of the features that are very suitable for bottom surface milling.

5 Flutes  $\phi 2 \sim \phi 4$

6 Flutes  $\phi 6 \sim \phi 12$

Short length of cut for high rigidity

**High precision**

- Note:
- Decrease the feed rate more than 50% from the milling parameters when slot milling.
  - Decrease both spindle speed and feed rate proportionally when the milling parameters exceed the machine's maximum spindle speed, or when chattering and red-hot occur.
  - Every coolant offers stable milling.

## Features

4 Flute Taper Neck Radius End Mills for milling hard materials. Corner radius design from the edge to the periphery ensures less cutting resistance, and the variable pitch design minimizes chattering and vibration. Can achieve stable milling and excellent surface finish on deep milling. HARDMAX coating offers longer tool life when milling hard materials. Recommended to use with any type of coolant.

### Feature ①

Seamless Corner Radius  
High rigidity! Less cutting resistance!

### Feature ②

Variable Pitch design  
Minimizing vibration and chattering !

※ Variable Pitch :  $\alpha \neq \beta$

### Feature ③

A wide choice of Taper Neck Angles available  
More efficient with 1.4° · 1.9° · 2.9° !

Unit (mm)

### Side Milling

### Note:

- Decrease both spindle speed and feed rate proportionally when the milling parameters exceed the machine's maximum spindle speed.
- Every coolant offers stable milling.

## Milling Example of Taper Slotting

HTNRS  $\phi 2 \times CR0.5 \times$  Neck Length 20 · 30 · 40

SKD61 (45HRC)

4 Flutes

- Work Size : 50 × 50 × 60 mm
- Inclined Angle : 1°
- Slot Length : 27 mm (L Shape Slot)  
21 mm (Straight Slot)
- Slot Width : 2.6 mm (Bottom)
- Slot Depth : 20, 30, 40 mm
- Coolant : Water Soluble

### ① Performance compared with straight neck type...Depth 20 mm L shape slotting

| Milling Process | Tool              | Neck Shape Helix Angle             | Tool Size (mm)                                      | Spindle Speed (min <sup>-1</sup> ) | Feed Rate (mm/min) | $a_p$ (mm) | Cycle Time       |
|-----------------|-------------------|------------------------------------|---|------------------------------------|--------------------|------------|------------------|
| Roughing        | HTNRS 4020-052018 | Taper Neck 0.9°<br>45° Helix Angle | $\phi 2 \times CR0.5 \times$<br>Neck Length 20      | 9,500                              | 2,450              | 0.064      | 20 min 18 sec    |
| Roughing        | HLRS 4020-05-200  | Straight Neck<br>30° Helix Angle   | $\phi 2 \times CR0.5 \times$<br>Effective Length 20 | 7,000                              | 800                | 0.025      | 1 h 30 min 9 sec |

**Taper neck is 7 times more efficient in 20 mm depth slotting !**

**Features**

Newly developed "HMGCOAT", carbide grade and tool shape offer higher wear/chipping resistance as compared to conventional tools.

Achieves longer tool life and highly precise milling on hard materials.

High Precision Diameter Tolerance / Radius Accuracy / Shank Diameter Tolerance

| Radius of Ball Nose | Diameter Tolerance | Ball Radius Accuracy | Shank Diameter Tolerance |
|---------------------|--------------------|----------------------|--------------------------|
| R0.05 ~ R0.075      | <b>0/-0.008</b>    | <b>±0.002</b>        | <b>0/-0.004 (h4)</b>     |
| R0.1 ~ R1.25        |                    | <b>±0.003</b>        |                          |
| R1.5 ~ R2           | <b>0/-0.01</b>     | ±0.005               |                          |
| R2.5 ~ R3           |                    |                      |                          |

**Shank diameter tolerance h4!**

The shank taper angle shown is not an exact value and to avoid contact with the workpiece, we recommend the user controls the precise value of this angle. Shank taper angle should not make contact with the work piece.

Note:

- Decrease the feed rate more than 50% from the milling parameters when slot milling.
- Decrease both spindle speed and feed rate proportionally when the milling parameters exceed the machines maximum speed, or when the tool is chattering and heats up to a red color.
- Every coolant offers stable milling.

**Features**

Offers high efficiency, long tool life and excellent surface finish on hard materials over 40HRC.

HARDMAX coat offers heat resistance, durability and lubricity at a high level.

Every coolant offers stable milling.

Ball tip point is designed with a negative rake angle that minimizes wear and improves the target dimensions.

The low negative rake angle at the peripheral side of the ball offers an excellent surface finish and prevents deflection.

The shank taper angle shown is not an exact value and to avoid contact with the work piece, we recommend the user controls the precise value of this angle. Shank taper angle should not make contact with the work piece.

**ATTENTION**

HSB 1001-0020-6 (R0.05) is a taper ball end mill with half included angle 10° (See the right drawing).

Note:

- Decrease the feed rate more than 50% from the milling parameters when slot milling.
- Decrease both spindle speed and feed rate proportionally when the milling parameters exceed the machines maximum speed, or when the tool is chattering and heats up to a red color.
- Reduce the milling parameters when a straight shank tool exceeds 35 mm of overhang length.
- Every coolant offers stable milling.

## Features

Short Shank Ball End Mills for high accuracy shrink-fit tool holder.

Offers high efficiency, long tool life and excellent surface finish on hard materials over 40HRC.

HARDMAX coat offers heat resistance, durability and lubricity at a high level.

Every coolant offers stable milling.

Ball tip point is designed with a negative rake angle that minimizes wear and improves the target dimensions.

The low negative rake angle at the peripheral side of the ball offers an excellent surface finish and prevents deflection.

Better Tolerance Design! Diameter Tolerance, Ball Radius Accuracy, and Shank Diameter Tolerance

## HSB / HSLB Tolerance

| Radius of Ball Nose | Diameter Tolerance | Ball Radius Accuracy | Shank Diameter Tolerance |
|---------------------|--------------------|----------------------|--------------------------|
| R0.1 ~ R3           | 0/-0.015           | ±0.005               | 0/-0.005 (h5)            |

## HSB-S / HSLB-S Tolerance

| Radius of Ball Nose | Diameter Tolerance | Ball Radius Accuracy | Shank Diameter Tolerance |
|---------------------|--------------------|----------------------|--------------------------|
| R0.1 ~ R1           | <b>0/-0.008</b>    | <b>±0.003</b>        | <b>0/-0.004 (h4)</b>     |
| R1.5 ~ R2           | <b>0/-0.01</b>     |                      |                          |
| R3                  |                    | ±0.005               |                          |

Shank diameter tolerance h4!

Short overhang length with short shank length!

Short overhang length minimizes tool run-out

High precision milling

Minimizes vibration and chattering

Longer tool life

Ideal for tool holders where the maximum insertion is short.

The shank taper angle and the shank length (H) shown are not an exact value and to avoid contact with the work piece, we recommend the user controls the precise value of this angle. Shank taper angle should not make contact with the work piece.

**Features**

Long shank ball design for hard materials.  
**HARDMAX** coating for high speed milling for Hard Materials.  
 Both dry and wet coolant offer stable and long tool life.  
 Diameter Tolerance: 0/-0.015 (D≤6), 0/-0.02 (D≥8)

Shank part should not make contact with the work piece.

Cutting Amount (mm)  
 $a_p = 0.04D$  (Max 0.5 mm)  
 $a_e = 0.1D$   
 $D$  : Outside Diameter (mm)

## Note:

- Decrease both spindle speed and feed rate proportionally in case of chattering.
- Set spindle speed, feed rate, and radial depth in accordance with the required surface quality.
- Adjust milling parameters according to the operating environment when milling a work piece over 60HRC.
- Recommend air blow or oil mist.
- Recommend oil coolant for Stainless Steels and Heat Resistant Alloys.
- Recommend wet coolant for Copper.

**Features**

The shank taper angle shown is not an exact value and to avoid contact with the work piece, we recommend the user controls the precise value of this angle. Shank taper angle should not make contact with the work piece.

**ATTENTION**

CSEB 1001-0020-6 is a taper ball end mill with half included angle 10° (See the right drawing).

| Radius of Ball Nose | Diameter Tolerance | Radius Accuracy | Helix Angle | Number of Flutes |
|---------------------|--------------------|-----------------|-------------|------------------|
| R0.05               | 0/-0.01            | ±0.002          | 0°          | 2 Flutes<br>*    |
| R0.1 ~ R3           | 0/-0.015           | ±0.005          | 30°         |                  |
| R3.25 ~ R6          | 0/-0.02            | ±0.007          | 30°         |                  |

\* Only CSEB 1001-0020-6 has single flute.  
R accuracy and diameter tolerance is the same as R0.1.

**3 Features of CSEB**

Reduce cutting resistance and designed to require surface quality.

Recommended for milling on hardened steels (55HRC) - sticky materials, materials that prone to chatter marks.

Less resistance on curved surface shape

Small relief surface

Tip design with excellent cutting performance

Total 78 models

## Note:

- Decrease the feed rate more than 50% from the milling parameters when slot milling.
- Decrease both spindle speed and feed rate proportionally when the milling parameters exceed the machines maximum speed, or when the tool is chattering and heats up to a red color.
- Recommend oil coolant for Stainless Steels and Heat Resistant Alloys.
- Recommend wet coolant for Copper.

## Features

**Diamond coated 2 flute ball end mills for Graphite Electrode milling.**

**New diamond coating with a highly adhesive base layer offers excellent wear resistance and longer tool life.**

The shank taper angle shown is not an exact value and to avoid contact with the work piece, we recommend the user controls the precise value of this angle. Shank taper angle should not make contact with the work piece.

## Note:

- Use a milling machine dedicated for Graphite.
- Recommend air blow for Graphite.

## Features

**Designed for milling Graphite.**  
**The chosen carbide grade offers excellent resistance to wear and abrasion.**  
**Refer to page 458 for 4 flute CGB.**

The shank taper angle shown is not an exact value and to avoid contact with the work piece, we recommend the user controls the precise value of this angle. Shank taper angle should not make contact with the work piece. Actual measurement is necessary when using longer length of cut than the written length.

For 3D milling / Finishing  
Milling Amount (mm)

$a_p = 0.3D$

$a_e = 0.7D$

D : Outside Diameter (mm)

Note:

· Use a milling machine dedicated for Graphite.

· Recommend air blow for Graphite.

## Graphite milling example

Work Size 150 × 150 × 150 mm

Cycle Time 2 h 18 min

**CGB 2000** Non-coated ball for Graphite milling

**CPRB** Non-coated long neck ball for Plastic milling

**Feature 1**  
High efficiency

**Big pocket** improves chip evacuation even with multi-flutes. Achieves **deep milling**.

Refer to P.447 Deep milling high efficiency roughing examples.

Wide angle

Deep tip pocket

## Feature 2 Tip slot effect

**Micro 3 slot design** at the tip prevents chip biting even at the peripheral speed zero point, providing **an excellent surface finish**.  
Micro 3 slot design is applied to R1 or above.

- ☆ **Radius accuracy** of the whole ball
- $\pm 0.005$  (R1 ~ R1.5)
  - $\pm 0.007$  (R2 ~ R3)
  - $\pm 0.01$  (R4 ~ R6)

## Comparison with 2 flutes (Ra) PXA30 30HRC

| Tool Diameter R3                              |        |
|---|--------|
| Spindle Speed (min <sup>-1</sup> )            | 14,000 |
| Feed Rate (mm/min)                            | 3,900  |
| $a_p$ (mm)                                    | 0.1    |
| $a_e$ (mm)                                    | 0.24   |
| Coolant<br>Water soluble<br>(Through Spindle) |        |

CFB enables highly efficient finishing with a wide pitch of  $a_e$  0.24.  
※ The Ra of CSEB and CFB are both the same at  $a_e$  0.12.

## Feature 3 Designed for a wide range of materials

Suited for various heat-resistant alloys including Titanium and Inconel due to **large pocket, variable pitch and high lubricity coating**.  
Tip slot design offers clean milling surfaces even for Copper, Aluminum and Acrylic.

| Copper, Acrylic                    |        |
|------------------------------------|--------|
| R3 Ball Finishing                  |        |
| Spindle Speed (min <sup>-1</sup> ) | 30,000 |
| Feed Rate (mm/min)                 | 4,000  |
| $a_p$ (mm)                         | 0.12   |
| $a_e$ (mm)                         | 0.12   |
| Coolant: Water soluble             |        |

**Copper C1100**  
55 × 50 × 23 mm  
Excellent surface roughness even on Copper that prone to chatter marks.

**Acrylic**  
55 × 50 × 23 mm  
Even Acrylic shows this high transparency without polishing.

Apply when a deep tool setting causes the toolholder to extend beyond the full shank diameter and over the taper angle. Use the table below to adjust the parameters when compensating for extended overhang on the straight type design.

## Milling Conditions for CFB

### ◆ Deep and high efficiency roughing (3xD overhang for straight type)

This parameter is effective in using the machine that has low acceleration and applying complex milling path that repeats accelerating/braking frequently.

- Note:
- Fix the work piece firmly, and use a machine that has high rigidity and generates a low level of vibration especially under high efficient deep milling condition in roughing process.
  - Decrease the feed rate more than 50% from the milling parameters when slot milling.
  - Decrease both spindle speed and feed rate proportionally when the milling parameters exceed the machines maximum speed, or when the tool is chattering and heats up to a red color.
  - Decrease both spindle speed and feed rate 10% for slope milling.
  - Decrease both spindle speed and feed rate to meet required precision and to prevent the shank making contact with the work piece.
  - DRY: air blow, WET: water soluble or oil coolant.
  - A long overhang may cause tool deflection, leaving uncut material.

## Features

Achieves dramatically higher feed rates with 3 flutes, shortening roughing time.

DLC coating offers excellent welding and wear resistance.

Offers highly efficient milling even for a slow-moving shape, with deep cut milling.

3 flute variable pitch design reduces chattering.

The 3 slots at the tip offers chip evacuation and improved surface finish. (Except R0.75 or below)

The shank taper angle shown is not an exact value and to avoid contact with the work piece, we recommend the user controls the precise value of this angle. Shank taper angle should not make contact with the work piece.

Apply when a deep tool setting causes the tool holder to extend beyond the full shank diameter and over the taper angle. Use the table below to adjust the parameters when compensating for extended overhang on the straight type design.

| WORK MATERIAL   | ALUMINUM ALLOYS A5052, A7075 |             |                      |                       |

Adjustments are recommended when finishing with an overhang of over 6 x D.

### ◆Deep and high efficiency roughing (overhang length ~3D for straight type)

This parameter is effective in using the machine that has low acceleration and applying complex milling path that repeats accelerating/braking frequently.

#### Note:

- Fix the work piece firmly, and use a machine that has high rigidity and generates a low level of vibration especially under high efficient deep milling condition in roughing process.
- Decrease the feed rate more than 50% from the milling parameters when slot milling.
- Decrease both spindle speed and feed rate proportionally when the milling parameters exceed the machines maximum speed, or when the tool is chattering and heats up to a red color.
- Decrease both spindle speed and feed rate 10% for slope milling.
- Decrease both spindle speed and feed rate to meet required precision and to prevent the shank making contact with the work piece.
- Recommend water soluble or oil coolant.
- A long overhang may cause tool deflection, leaving uncut material.

Features

Dramatically improved the milling efficiency. Maximum 27 times higher chip evacuation compared to conventional tool.  
 New ball tip design offers polish-less bottom surface finishing.  
 Affordable pricing.  
 Diameter Tolerance: 0/-0.02

The shank taper angle shown is not an exact value and to avoid contact with the work piece, we recommend the user controls the precise value of this angle. Shank taper angle should not make contact with the work piece.

## Features

Compatible with shrink-fit toolholder systems for high efficiency.  
A shorter overhang offers higher feed rates and precision.  
Diameter Tolerance: 0/-0.02

The shank taper angle and the shank length (H) shown are not an exact value and to avoid contact with the work piece, we recommend the user controls the precise value of this angle. Shank taper angle should not make contact with the work piece.

## Milling Conditions for HFB / HFB-S

Please adjust milling parameter according to overhang length, referring to the following table.

### Radius of Ball Nose R1 ( $\phi 4$ shank), R1.5

| Overhang Length            | Spindle Speed (min <sup>-1</sup> ) | Feed Rate (mm/min) | $a_p$ (mm)    | $a_e$ (mm)    |
|----------------------------|------------------------------------|--------------------|---------------|---------------|
| $\phi D \times 5$ or below | $\times 1$                         | $\times 1$         | $\times 1$    | $\times 1$    |
| $\sim \phi D \times 6$     | $\times 0.9$                       | $\times 0.9$       | $\times 0.95$ | $\times 0.95$ |
| $\sim \phi D \times 7$     | $\times 0.8$                       | $\times 0.8$       | $\times 0.9$  | $\times 0.95$ |
| $\sim \phi D \times 8$     | $\times 0.7$                       | $\times 0.7$       | $\times 0.85$ | $\times 0.9$  |
| $\sim \phi D \times 9$     | $\times 0.65$                      | $\times 0.6$       | $\times 0.8$  | $\times 0.9$  |
| $\sim \phi D \times 10$    | $\times 0.55$                      | $\times 0.5$       | $\times 0.75$ | $\times 0.85$ |

### Radius of Ball Nose R1 ( $\phi 6$ shank)

| Overhang Length         | Spindle Speed (min <sup>-1</sup> ) | Feed Rate (mm/min) | $a_p$ (mm)    | $a_e$ (mm)    |
|-------------------------|------------------------------------|--------------------|---------------|---------------|
| $\phi D \times 6$       | $\times 1$                         | $\times 1$         | $\times 1$    | $\times 1$    |
| $\sim \phi D \times 7$  | $\times 0.85$                      | $\times 0.9$       | $\times 0.95$ | $\times 0.95$ |
| $\sim \phi D \times 8$  | $\times 0.7$                       | $\times 0.8$       | $\times 0.9$  | $\times 0.9$  |
| $\sim \phi D \times 9$  | $\times 0.55$                      | $\times 0.75$      | $\times 0.85$ | $\times 0.9$  |
| $\sim \phi D \times 10$ | $\times 0.4$                       | $\times 0.65$      | $\times 0.8$  | $\times 0.85$ |

### Radius of Ball Nose R1.5 (Short shank)

| Overhang Length            | Spindle Speed (min <sup>-1</sup> ) | Feed Rate (mm/min) | $a_p$ (mm)   | $a_e$ (mm)    |
|----------------------------|------------------------------------|--------------------|--------------|---------------|
| $\phi D \times 5$ or below | $\times 1$                         | $\times 1$         | $\times 1$   | $\times 1$    |
| $\sim \phi D \times 6$     | $\times 0.55$                      | $\times 0.3$       | $\times 0.4$ | $\times 0.55$ |

### Radius of Ball Nose R2 or above

| Overhang Length            | Spindle Speed (min <sup>-1</sup> ) | Feed Rate (mm/min) | $a_p$ (mm)    | $a_e$ (mm)    |
|----------------------------|------------------------------------|--------------------|---------------|---------------|
| $\phi D \times 3$ or below | $\times 1$                         | $\times 1$         | $\times 1$    | $\times 1$    |
| $\sim \phi D \times 3.5$   | $\times 1$                         | $\times 0.85$      | $\times 0.85$ | $\times 0.9$  |
| $\sim \phi D \times 4$     | $\times 1$                         | $\times 0.8$       | $\times 0.7$  | $\times 0.8$  |
| $\sim \phi D \times 4.5$   | $\times 0.85$                      | $\times 0.55$      | $\times 0.6$  | $\times 0.75$ |
| $\sim \phi D \times 5$     | $\times 0.7$                       | $\times 0.35$      | $\times 0.6$  | $\times 0.75$ |
| $\sim \phi D \times 5.5$   | $\times 0.55$                      | $\times 0.25$      | $\times 0.55$ | $\times 0.7$  |
| $\sim \phi D \times 6$     | $\times 0.4$                       | $\times 0.15$      | $\times 0.5$  | $\times 0.7$  |

## Milling Conditions for HFB / HFB-S

### ◆Finishing (overhang length ~6D)

| WORK MATERIAL |                          | PREHARDENED STEELS / HARDENED STEELS<br>(35~60HRC)<br>Coolant: Oil Mist |                    |                        |                         |
|---------------|--------------------------|---|--------------------|------------------------|-------------------------|
| Model Number  | Radius of Ball Nose (mm) | Spindle Speed (min <sup>-1</sup> )                                      | Feed Rate (mm/min) | Axial Depth $a_p$ (mm) | Radial Depth $a_e$ (mm) |
| 4020-0300     | R1                       | 26,000  | 2,000              | 0.02                   | 0.06                    |
| 4030-0450     | R1.5                     | 25,000  | 1,800              | 0.03                   | 0.07                    |
| 4040-0600     | R2                       | 22,500  | 1,500              | 0.04                   | 0.08                    |
| 4060-0900     | R3                       | 15,000  | 1,000              | 0.06                   | 0.12                    |
| 4080-1200     | R4                       | 11,250  | 750                | 0.08                   | 0.16                    |
| 4100-1500     | R5                       | 9,000   | 600                | 0.1                    | 0.2                     |
| 4120-1800     | R6                       | 7,500   | 500                | 0.12                   | 0.24                    |

**Note:**

- Decrease the feed rate more than 50% from the milling parameters when slot milling.
- Decrease both spindle speed and feed rate proportionally when the milling parameters exceed the machines maximum speed, or when the tool is chattering and heats up to a red color.
- Adjustments are recommended when finishing with an overhang of over 6xD.
- Recommend air blow or oil mist. For materials under 45HRC, recommend water soluble coolant.

## Feature 1 Special Design Achieves Outstanding Chip Evacuation

### HFB Design

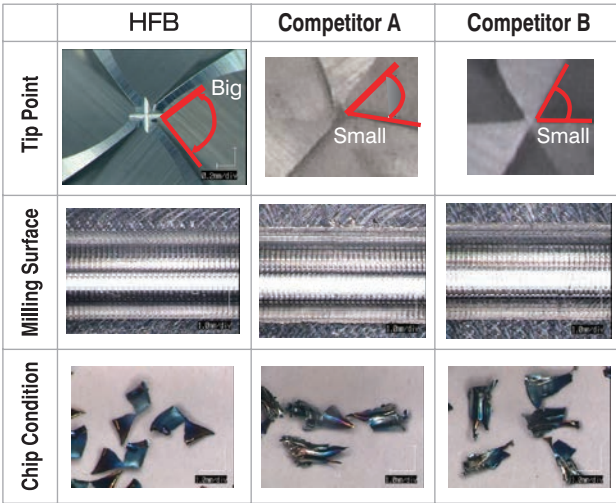

Flat (Non-rolled up) chip shape shows smooth chip evacuation.

### Conventional Design

Smooth chip evacuation achieves more stable milling.

|                 |   |
|-----------------|---|
| Tool            | R2  |
| Work Material   | YXR33 (58HRC)                             |
| Spindle Speed   | 6,000 min <sup>-1</sup>                   |
| Feed Rate       | 2,400 mm/min<br>(Slotting : 1,200 mm/min) |
| $a_p$           | 1 mm (0.25D)                              |
| $a_e$           | 1 mm (0.25D)                              |
| Overhang Length | 15 mm                                     |
| Coolant         | Air Blow (Through Spindle)                |
| Pocket Size     | 100 × 20 × 6 mm<br>(X × Y × Z)            |
| Cycle Time      | 28.2 min                                  |

D : Outside Diameter

The large pocket design of the HFB promotes better chip evacuation and longer tool life when compared to a conventional design which shows premature damage.

## Feature 2 Polish-less Milling by 4 Tip Grooves

### STAVAX (53HRC) Milling Example: Flat Surface Finishing HFB (R3)

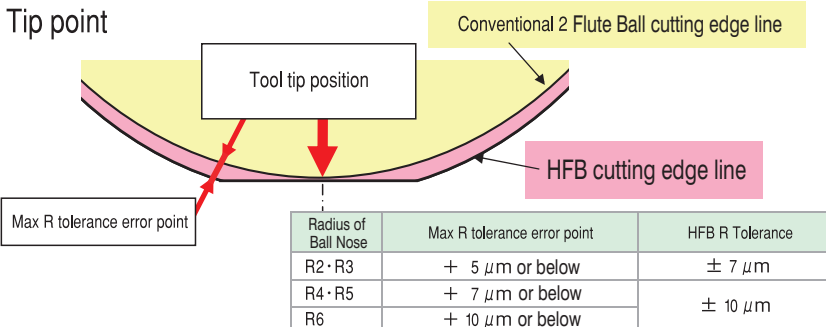

|               |                          |
|---------------|--------------------------|
| Spindle Speed | 12,800 min <sup>-1</sup> |
| Feed Rate     | 2,500 mm/min             |
| $a_p$         | 0.06 mm (0.01D)          |
| $a_e$         | 0.12 mm (0.02D)          |
| Coolant       | Oil Mist                 |

4 grooves on the tip point help surface finishing process. Max roughness values was 0.9  $\mu$ m on 1 hour testing.

The tool condition is better than conventional 2 Flutes.

### Tip point

Smooth chip evacuation reduces damage at the tip.

## Features

Designed for milling Graphite.  
The chosen carbide grade offers excellent wear resistance.  
Refer to page 440 for 2 flute CGB.

Actual measurement is necessary when using longer length of cut than the written length.

Total 9 models

Unit (mm)

| Model Number | Radius of Ball Nose R | Length of Cut l | Overall Length L | Shank Diameter φd | Shape | Suggested Retail Price ¥ |

For 3D milling / Finishing  
Milling Amount (mm)

$$a_p = 0.3D$$

$$a_e = 0.7D$$

D : Outside Diameter (mm)

Note:

- Use a milling machine dedicated for Graphite.
- Recommend air blow for Graphite.

### Other series for Graphite milling
